

# Appendix A. Methodology for Gender Analysis

Chapter 1 describes IEG’s analysis of the approach adopted by World Bank Group projects and country strategies to address gender issues, and the features of its monitoring and evaluation (M&E) frameworks. The analysis used an in-depth review of key operational documents of World Bank Group projects and country strategies that closed in FY12–14.

## Criteria for Sample Selection

IEG selected its sample of projects from 843 World Bank investment project financing (IPF) and 191 development policy financing (DPF) operations that closed between FY12 and FY14. For IBRD and IDA, IEG identified a sample of 231 IPF operations based on the following:

- Projects posted an Implementation Completion and Results Report as of July 13, 2015 (the latest date available for inclusion in the analysis)
- Projects closed in either FY12 or FY14
- The 2010 IEG gender evaluation reviewed the projects.<sup>1</sup>

The review did not include DPFs because they were not included in the 2010 IEG gender evaluation. A review of DPFs would have required an ad hoc approach that IEG considered beyond the scope of this analysis.

Since IFC projects were not included in the 2010 gender evaluation, IEG reviewed the 226 Investment Services and 184 Advisory Services projects that were evaluated in FY12–14.<sup>2</sup> The review did not cover MIGA operations; MIGA is working toward strengthening its focus on gender equality, but only recently committed to tracking gender-disaggregated indicators.

The review covered all 58 country strategies that closed during FY12–FY14.

**Table A.1. Overall Portfolio Composition**

	FY	N
Investment project financing (IBRD and IDA)	12 and 14	231 (sample)
Investment (IFC)	12 to 14	226 (sample)
Advisory (IFC)	12 to 14	190 (sample)
Country strategies	12 to 14	58 (all)

## Data Collection for World Bank Group Projects

The 2010 gender evaluation dataset includes a rich set of variables capturing the degree of gender integration for each project at the design stage. IEG collected information on the following:

- Gender analysis as documented in program documents (if it was carried out and how extensive it was)
- Gender-relevant activities (if they were planned, which ones, and so on)
- Indicators aimed to measure gender-relevant results (if they were included in the project M&E, which ones, and so on).

The portfolio review conducted by the 2010 IEG gender evaluation team included data extracted from Project Appraisal Documents, and thus derived from an analysis of the level of gender integration at entry. The RAP team reviewed the 2010 IEG gender evaluation dataset and confirmed or rejected its information for inclusion, to ensure consistency. Using this dataset allowed the analysis to use additional information and minimized any inclusion error that may have occurred in the data collection process. Along with this dataset, IEG individually scrutinized project documents at the design (Project Appraisal Document), completion (Implementation Completion Report), and validation (Implementation Completion Report Reviews) stages to extract information about gender-related consultations, diagnostics, objectives, beneficiaries, actions, and indicators. The goal was to assess how changes during implementation affected the results expected at entry, whether those results were monitored and tracked, and whether the project reported on any additional gender-relevant results.

Although the 231 investment lending projects included in the analysis were not randomly sampled from all those that closed in FY12–FY14, the criteria for sample selection are expected to be uncorrelated with the goal of the exercise and the outcomes of interest. Overall, the selected projects were well distributed across World Bank Regions (table A.2). Furthermore, the distribution across fiscal years (at closing) and overall project rating is similar to the total universe analyzed for the rest of the report (table A.3).

Table A.2. Investment Lending Gender Portfolio, by Region

Region	Frequency	Percent
Sub-Saharan Africa	68	29.4
East Asia and Pacific	40	17.3
Europe and Central Asia	49	21.2
Latin America and the Caribbean	33	14.3
Middle East and North Africa	14	6.1
South Asia	27	11.7
Total	231	100.0

**Table A.3. Investment Lending Projects Included in and Excluded from the Gender Analysis, by Closing FY and Overall Rating**

Closed FY	All projects (percent)			Projects rated MS+ (percent)		
	Gender portfolio (n=231)	Excluded from gender portfolio (n=203)	Total RAP (n=434)	Gender portfolio	Excluded from gender portfolio	Total RAP
2012	61.9	61.1	61.5	68.0	68.0	68.0
2014	38.1	38.9	38.5	70.0	80.0	75.0
Total	100.0	100.0	100.0	69.0	72.0	71.0

*Note:* FY = fiscal year; MS+ = moderately satisfactory or better; RAP = *Results and Performance of the World Bank Group*.

IEG analyzed IFC projects using text analytics tools to screen out projects that did not include any reference to gender since these were expected to be the majority. The screening used the following key words: gender, female, male, girl, boy, women, men, and maternal. IEG next analyzed the remaining Advisory Services and Investment Services projects to discern whether a project had a gender objective, gender activities, and whether the indicators planned and collected were gender-relevant.

### Data Collection for World Bank Group Country Strategies

IEG reviewed all the reporting documents referring to the 58 country strategies that closed between FY12 and FY14. Table A.4 reports the distribution of country strategies across Regions. IDA country strategies were 65 percent of the country strategies reviewed.

**Table A.4. Country Strategies Documents, by Region**

Region	Frequency	Percent
Africa	20	34
East Asia and Pacific	8	14
Europe and Central Asia	14	24
Latin America and the Caribbean	9	16
Middle East and North Africa	4	7
South Asia	3	5
Total	58	100

The RAP team scrutinized the individual country strategy documents at the design (Country Assistance Strategies and Country Partnership Strategies), completion (Country Assistance Strategy Completion Reports), and validation (Country Assistance

## APPENDIX A METHODOLOGY FOR GENDER ANALYSIS

Strategy Completion Report Reviews) stages to extract information about gender-related consultations, diagnostics, objectives, beneficiaries, actions, and indicators. Five IEG Country Program Evaluations completed during the same period were also included in the review.

### Data Analysis

After collecting all the information from individual projects and country strategy documents at the design and completion stage, IEG analyzed the information, searching for the following:

- The explicit rationale for gender-relevant actions and results included in project documents and country strategies
- Discussion of the implicit results chain in all projects and country strategies that included gender-relevant activities or that expected specific gender-relevant results
- Any supportive evidence that projects and country strategies used to report on gender-relevant results.

Without World Bank Group criteria to assess relevance for gender integration for projects, the RAP team developed a specific approach, detailed in chapter 1. The team individually screened the development objectives and social impacts of each IPF, as stated in Project Appraisal Documents, to categorize projects as relevant (or not) for gender integration, and reviewed project components when needed. To reduce errors due to differences in individual judgment, IEG used multiple coders and the information available in the 2010 IEG gender evaluation. Double coding (including reading the project narrative) was used to agree on any discrepancies between the coders' classification and the classification available in the 2010 dataset.

### Additional Sources of Information

A review of additional evidence available in corporate documents and recently completed IEG evaluations complemented the exercise. Corporate documents reviewed include, among others, the following:

- *Implications of WDR 2012: Gender Equality and Development for the World Bank Group* and its periodic updates
- IDA16 Progress and Completion Reports
- IDA17 Progress Report
- World Bank Group Corporate Scorecards
- World Bank Core Sector Indicators
- IFC Roadmaps FY13–15, FY14–16, and FY15–17 (IFC 2012a, 2013, 2014)

- 2012 IFC Policy on Environmental and Social Sustainability and its accompanying Guidance Note on Performance Standards on Environmental and Social Sustainability (IFC 2012b)
- The Gender Strategy of the World Bank Group approved in December 2015 (World Bank 2015d).

IEG evaluations and learning products reviewed include the following:

- The gender evaluation (IEG 2010a)
- The Biennial Report on Operations Evaluation (IEG 2013a)
- The investment climate evaluation (IEG 2015d)
- The youth employment evaluation (2013h)
- The low-income, fragility and conflict-affected states evaluation (IEG 2013g)
- The social safety nets and gender (IEG 2014e)
- The poverty evaluation (2015g)
- The early childhood development evaluation (IEG 2015j)
- The electricity evaluation (IEG 2015i)
- The financial inclusion evaluation (IEG 2015b).

---

<sup>1</sup> The 2010 gender evaluation database includes 1,183 investment loans in 93 countries approved between FY02 and FY08. To be included in the IEG evaluation, countries needed to have a population of more than 1 million, more than two investment projects and a prepared Country Assistance Strategy (CAS) or equivalent during the evaluation period, and a gross domestic income and human development index. These criteria were adopted to capitalize on the large amount of information collected, coded, and assessed by that evaluation.

<sup>2</sup> IEG reviews only a sample of IFC operations each year.

# Appendix B. Correlations and Regression Model of the World Bank Portfolio

Tables B.1–B.3 in this appendix summarize information about investment project financing (IPF) projects closed in FY09–FY14 that have IEG-validated Implementation Completion Report Review project outcome ratings.

Table B.1. Correlation Coefficients

Project-level variables	Correlation with outcome rating
Quality at entry rating	0.6681
Quality of supervision rating	0.6623
M&E quality rating	0.5398
Project was flagged as a problem project at some point during implementation	–0.3894
Change in size: final project size minus initial project size (log)	0.3687
Net commitment: final project size (log)	0.2409
Initial commitment: initial project size (log)	0.1267
TTL turnover (number of TTLs ever assigned to the project)	–0.1065
Preparation time (months from Concept Note to project approval)	–0.0780
Supervision cost (log)	–0.0130
Planned length of the project (months)	–0.0099
Preparation cost (log)	–0.0001
Country-level variables	Correlation with CPIA
WGI: Government Effectiveness	0.8543
WGI: Regulatory Quality	0.8533
WGI: Rule of Law	0.7383
WGI: Control of Corruption	0.6636
Fragile and/or conflict status	–0.6302
Gender Inequality Index	–0.6123
Human Development Index	0.6039
GDP per capita (log)	0.5421
WGI: Voice and Accountability	0.5208
WGI: Political Stability and Absence of Violence and/or Terrorism	0.4964

## Appendix C. Selected Project-Specific Variables by World Bank Region and Global Practice

Tables and figures in this appendix (starting on the next page) present selected project-specific variables by World Bank Regions and Global Practices (GPs). The analysis used the following project-specific variables: preparation cost, supervision cost, number of task team leaders (TTLs) ever assigned to a project in Bank systems, and whether a project was ever labeled a problem project. This breakdown was done for the same projects used in the regression analysis to explore performance factors of World Bank projects. The projects were all IPFs closed in FY09–FY14 that have IEG-validated Implementation Completion Report Review project outcome ratings.

# Appendix D. Quantitative Analysis of IFC Investment Project Performance

IEG completed a quantitative analysis of IFC investment project performance for two reasons:

- Considering the Board discussions surrounding the findings of the *Results and Performance of the World Bank Group 2014* (IEG 2014d), this analysis looks at possible differences in performance depending on project size.
- Given the prolonged downward trend in IFC investment project performance, IEG sought to obtain a directional indication of the performance of more recent projects, which will achieve early operating maturity and soon be eligible for evaluation (2015 and 2016 evaluations).

IEG developed a benchmark based on 259 real sector and 136 financial and bank sector projects evaluated between 2009–14 based on the regression model used in RAP 2013 (IEG 2013f). The model factored in project size and other known influencers of the development outcome, specifically:

- **Outcome variable:** Development outcome based on a six-point scale (1 = highly unsatisfactory; 2 = unsatisfactory; 3 = moderately unsatisfactory; 4 = moderately satisfactory; 5 = satisfactory; and 6 = highly satisfactory)
- **Project size:** Measured by a natural logarithm of net commitment (in millions of dollars)
- **Three internal indicators of IFC work quality** (coded as binary variables)
  - Screening, appraisal, and structuring
  - Supervision and administration
  - Role and contribution.
- **External risk factors, project level** (coded as binary variables)
  - Profit margin for real sector projects
  - Management quality for real sector and bank projects
  - Corporate governance for bank projects.
- **External risk factor, country level:** Risks captured by changes in the Institutional Investor Country Credit Risk ratings (IICCR) between project approval year and evaluation year.
- **World Bank Group regional fixed effects:** Included to control for regional-level variations in development outcome not captured by work quality and external factors.

APPENDIX D  
 QUANTITATIVE ANALYSIS OF IFC INVESTMENT PROJECT PERFORMANCE

Taking into account all variables, the empirical framework is formulated in the equation below:

$$Outcome_i = f(Size_i, WQ_i, ERF_i, RFE_i) + \varepsilon_i$$

In this equation, WQ represents IFC work quality, ERF represents external risk factors (project and country level), and RFE represents regional fixed effects. The regressions are carried out using ordered probit model. As shown on table D.2, the (log) commitment amount is positively associated with the development outcome in general, while statistical significance levels vary by the inclusion of risk factors and the sector of the projects. More specifically, for real sector projects, the association of commitment size with development success diminished as work quality measures and external risk factors were added to the model (column 2 versus column 1). For financial and bank sector projects, the association is stronger when controlling for risk factors (column 4 versus column 3). IEG also found that high-quality work could mitigate external risks; that is, activities within IFC’s control can increase the chances that a project will succeed. The quality of appraisal had the greatest impact for real projects, while the quality of IFC role and contribution had the largest effect for bank projects.

For exploring the directional implication of 2015 and 2016 projects, the same set of regressions as in table D.2 are run by attaching more weight to the more recent years of the benchmark sample (weight 2014 = 1; 2013 = 0.8; 2012 = 0.6; 2011 = 0.4; 2010 = 0.2; and 2009 = 0). The regressions are qualitatively similar to table D.2.

Table D.1. Risk Factors as Drivers of Development Outcome

Risk factors	Assessment
Change in country conditions (change in IICCR)	Projects tend to do better in countries where the investment climate improves. <sup>a</sup>
Profit margin (for real sector Credit Risk Rating <sup>b</sup> model)	Profitability ratios against industry peers (Good/OK = low risk; Poor/Bad = high risk)
Management quality	Qualitative assessment of management’s strategy, capacity, and success in implementation (good/OK = low risk; poor/bad = high risk)
Corporate governance (for bank Credit Risk Rating model)	Ownership structure, possibility of related party lending/expropriation of shareholders, and so on (good/OK = low risk; poor/bad = high risk)
Screening, appraisal, and structuring (IEG XPSR rating)	The extent to which IFC identified key risk factors and mitigated them, arrived at realistic expectations for project and company performance, and so on
Supervision and administration (IEG XPSR rating)	After approval and commitment, this indicator assesses how well IFC carried out its supervision of an investment
Role and contribution (IEG XPSR rating)	Determines the extent to which IFC played a catalytic role in an investment and made a special contribution

Note: IICCR = Institutional Investor Country Credit Risk; XPSR = Expanded Project Supervision Report.

## QUANTITATIVE ANALYSIS OF IFC INVESTMENT PROJECT PERFORMANCE

a. The country conditions or IICCR ratings here are based on information provided by senior economists and sovereign risk analysis at leading global banks, and money management and securities firms. The respondents grade each country on a scale of 0 to 100, with 100 representing the least likelihood of default. The IICCR weighs institutions' responses according to their global exposure.

b. IFC's Credit Risk Rating system is a computer-assisted tool developed to measure the credit risk of an investee company using general and specific risk factors based on quantitative data or qualitative assessments, which require IFC investment staff to apply judgment. Credit Risk Ratings are applied before the first commitment and are updated quarterly over the life of an IFC project.

Table D.2. Regression Analysis (Dependent Variable: Development Outcome)

Explanatory variables	Real sector projects		Financial and bank sector projects	
	(1)	(2)	(3)	(4)
Project size (net commitment in log)	0.309*** (0.071)	0.095 (0.073)	0.127 (0.084)	0.167* (0.096)
Work quality: screening, appraisal, and structuring		1.049*** (0.184)		0.701*** (0.217)
Work quality: supervision		0.478** (0.195)		0.583** (0.266)
Work quality: role and contribution		0.863*** (0.194)		0.839*** (0.293)
Management risk: real sector projects		-0.822*** (0.199)		
Profit margin risk: real sector projects		-0.885*** (0.157)		
Management risk: Bank projects				-0.781*** (0.293)
Corporate governance risk: Bank projects				-0.090 (0.255)
Change in IICCR		0.010 (0.009)		0.060*** (0.018)
Region fixed effects	Yes	Yes	Yes	Yes
Observations	259	259	136	136

Notes: Columns (1) and (3) control for project size and Region fixed effects, while columns (2) and (4) have a more complete set of control variables. All coefficients are estimated using ordered probit regression. Robust standard errors are in parentheses.

IICCR = Institutional Investor Country Credit Risk.

# Appendix E. Region Updates

## Africa

### REGIONAL CHALLENGES AND EVALUATION FINDINGS FROM WORLD BANK GROUP OPERATIONS IN THE REGION

According to the recent assessment by the Africa Region, economic growth in the region is expected to decline to 3.4 percent in 2015 from the 4.6 percent in 2014. In the context of continuing uncertainties in the global economy and with declines in the price of oil and other primary commodities, economic growth prospects for the Africa Region in the near term will remain well below the peak growth rate of 6.4 percent in 2002–2008. These economic developments will hamper progress in reducing extreme poverty in the region.

The World Bank Group's priorities for boosting shared prosperity in the Africa Region focus on the following:

- Boosting productivity and competitiveness with investments in energy, transport, higher education and science and technology, urban planning, and financial services
- Social protection, health, gender disparities, water supply and sanitation, and climate change (better targeting the poor)
- Economic management and governance
- Strengthening connectivity through regional integration, taking advantage of economies of scale, and enhancing productivity.

New World Bank lending commitments for Sub-Saharan African countries in fiscal year 2015 (FY15) surpassed the record FY14 level (table 5), with sharp increases in commitments for macroeconomics and fiscal management; health, nutrition, and population; and social protection and labor. Support for agriculture, energy and extractives, and transport and information and communications technology (ICT) remain important components.

Performance of the World Bank's portfolio in the Africa Region remains below average (figure 1), though the gap has been narrowing largely because of deteriorating performance in other Bank Regions. The outcomes of 66 percent of the Africa projects that exited the Bank portfolio in FY12–14 were rated moderately satisfactory or higher by IEG compared with the Bank average of 70 percent. Performance of the Region's projects from the Global Practices of Poverty, Transport and Information and Communications Technology was better than the Bank-wide performance in those Global Practices (GPs) but lagged behind in Agriculture,

Education, Finance and Market, and Governance (table 1). Performance in the Africa Region was better than that of the Middle East and North Africa Region and on par with the East Asia and Pacific Region. The success rates of International Development Association (IDA) and International Bank for Reconstruction and Development (IBRD) operations in Africa Region were 66 percent and 86 percent, respectively. Performance of governance operations continued to be generally poor, with the Bank-wide average slightly better than in the Africa Region.

IEG produced 23 Project Performance Assessment Reports (PPARs) for completed projects in Africa Region in FY12–15 and rated the outcome of 13 of the projects moderately satisfactory or higher. Poor quality at entry creates difficulties for project implementation and the achievement of satisfactory development outcomes. Design issues, including complex and overambitious projects, overestimation of implementation capacity, and optimistic assessment of government commitment and engagement, are major weaknesses in quality at entry.

Some countries with long and sustained engagement with the Bank had significantly poor portfolio performance (table 4). Senegal, Ghana, and Uganda stand out for their engagement with the Bank in numerous projects, policy-based operations, and analytical works, and for the Bank's strong local presence. Bank portfolio performance in these countries shows that the long engagement has not fostered effective partnerships in project design, implementation, and results. IEG reviewed 19 operations in these three countries and rated only four moderately satisfactory or higher on quality at entry – two operations in Senegal and two in Uganda. Project outcome ratings were similarly poor, with only three projects rated moderately satisfactory or higher out of seven in Senegal, two out of six in Uganda, and three out of six in Ghana.

IEG reviews show that a common cause of poor performance in these three countries is the failure of governments to implement agreed actions in a timely manner. For example, restoring financial viability to the electricity subsector in Senegal was regarded as central for expanding investments and improving efficiencies in the subsector. The Bank supported these sectoral objectives with the 2005 Senegal Electricity Sector Efficiency Enhancement Project and a development policy operation (DPO), the 2008 Energy Sector Recovery Development Credit. However, financial viability was not achieved as the government failed to take necessary reform actions. IEG gave the outcomes of both Bank operations a rating of unsatisfactory. Similarly, for the 2003 Ghana Land Administration Project, the land bill to harmonize statutory and customary authority over land, and hence facilitate land administration, was not adopted. The PPAR also found the project design too complex and rated the quality at entry and outcome as moderately unsatisfactory.

## APPENDIX E REGION UPDATES

Uganda, 2006 Public Service Performance Enhancement Project was intended to strengthen its public service. The start of implementation of the project was delayed for 18 months due to the delay in getting the necessary approval by parliament. The project's complex and overambitious design was a challenge. In addition, the several implementing agencies were short on capacity and the coordinating agency, the Ministry of Public Service, lacked the capacity to lead such a complex operation. Delays and poor implementation actions marred the outcome of the project. IEG rated overall borrower performance and the outcome of the project unsatisfactory.

Projects addressing overarching institutional issues, often with complex designs, and without obvious benefits and beneficiaries, have high risks of failure. The 2006 Guinea Coastal Marine and Biodiversity Management Project and the 2008 Benin Community-Based Coastal and Marine Biodiversity Management Project each covered numerous institutional change activities. Both suffered from complex design, weak implementation capacity, and uncertain political commitment. The outcomes of both projects were rated as unsatisfactory. Similar interventions in Senegal, the 2004 Integrated Marine and Coastal Resources Management Project and the 2006 Sustainable Management of Fish Resources Project, involved substantial institutional reforms. The project had three project implementation units in different agencies, needing high and improbable levels of interagency coordination and government engagement to be successful. The achievements were negligible, and IEG rated the outcomes unsatisfactory and highly unsatisfactory, respectively. By contrast, for the 2004 Malawi Community-Based Rural Land Development Project, the intended beneficiaries understood its potential impact. The project was conceived as a pilot with a narrow focus and its pioneering design was informed by experience in other countries, solid analytical work, and lessons from the government's experience with land distribution. The outcome of the project received a rating of satisfactory from IEG.

Governance operations, often focused on public sector institutional reforms and capacity development, perform poorly in the Bank and particularly in the Africa Region (table 5). This reflects ambitious designs, weak implementation capacity, and often lack of firm government commitment that hampers prompt and sustained actions on the reforms. Designs that are simple and focused on a few key measures, with strong government engagement in the implementation of projects, can reduce the risks of failure. The 2004 Rwanda Decentralization and Community Development Project and the 2003 Mozambique Decentralized Planning and Finance Project are good examples of simplicity and focus in design. Both projects focused narrowly on building institutional capacities of local authorities for service delivery through participatory planning processes. The designs also benefitted from prior pilot projects and drew from experience in neighboring countries. The governments,

recognizing the projects as valuable for their efforts to promote participatory local governance, were fully engaged in the process. IEG rated the outcomes of the Rwanda and Mozambique projects as moderately satisfactory and satisfactory, respectively.

Monitoring and evaluation (M&E) in project implementation in the Africa Region remains weak, hindered by several institutional challenges. IEG rated 26 percent of M&E of projects in the Africa Region high or substantial, compared to 29 percent for the Bank as a whole (table 6). The challenges of M&E include the complexities of project design, the lack of capacity and baseline and other data, and the low priority given to M&E by the Bank and the borrowers. IEG found the M&E of the 2008 Cameroon Water Affirmage – Output-Based Aid for Coverage Expansion, unduly ambitious for the available implementation capacity. Furthermore, implementation was hampered by the failure of other agencies to provide the necessary data. For the 2009 Tanzania Accelerated Food Security Project, baseline and mid-term surveys were late and the design of the M&E of the 2011 Nigeria Statistics Development Program left out important indicators and baseline values were missing. Learning from experience could help improve M&E, but for the Mauritania Adaptable Program Loan for Irrigated Agriculture, the second phase did not benefit from the experience of the first phase and the quality of M&E remained negligible.

Timely design of the M&E framework, taking into account capacity constraints, and collaboration with other institutions that gather relevant data, enhances M&E results and utilization. For the 2003 Mozambique Decentralized Planning and Finance, the manual for the monitoring framework, written up during project preparation, was tailored to Mozambique's needs, capacity, and institutions. Further, the project financed M&E specialists to support implementation. In the 2008 Ethiopia Nutrition Project the indicators were well linked to the project's development objectives and data gathering and evaluation were carried out with established institutions. Demand for M&E data encourages good design and implementation. As an example, the M&E framework for the 2011 Burkina Faso Eleventh Poverty Reduction Support Credit was generally solid, the process was fully owned by the government and its results fed the annual progress reports that were discussed by the government and its development partners.

The Africa Region's success rate was above International Finance Corporation (IFC) averages for Investment Services but below for Advisory Services. For FY12–14, IEG validated 40 investment projects and assigned mostly successful or higher ratings to 23 projects (58 percent), which was the same as the IFC average (table 2). By investment commitments, the Region's success rate was 76 percent, compared to an IFC average success rate of 69 percent. During the review period, IEG validated 45

## APPENDIX E REGION UPDATES

Advisory Services projects and assigned mostly successful or higher ratings to 26 projects (58 percent), compared to an IFC average of 64 percent (table 3).

IEG evaluations of a number of regional investment initiatives for the Africa Region found that IFC's investment project front-end work can be improved further. One regional initiative was unsuccessful as IFC had overlooked various key risks at appraisal, including demand assessment and relevant experience of the management team. For another regional investment initiative, similar shortcoming of the front-end work was made up by the strength of the sponsor. The lessons for a future regional investment initiatives include: (i) regional sponsors need to be carefully selected and approached as relationships, as opposed to projects; (ii) projects with such sponsors require substantial commitment of resources if the intention is to fully exploit their potential; and (iii) the overall macro-risk associated with such entities need to be carefully analyzed in terms of the level of diversification to structure investments properly and to ensure acceptable U.S. dollar risk-return profiles. Another key lesson from IEG evaluations was the need to build regional institutions' capacity to implement a regional program. If institutional capacity building is required, it should be carried out in the early stages of the project before undertaking complex activities.

Effective M&E is essential to assess the impact of IFC Advisory Services projects on market transformation. Reviews of projects such as Lighting Africa project in Kenya underscore the importance of having an effective M&E and results framework to capture the underlying theory of change and how an Advisory Services project can make an impact on market transformation. To monitor progress toward transformation, specific project indicators should be identified and tracked since standard IFC indicators may not fit or be suitable for all Advisory Services projects. This was evident in the Global Index Insurance Facility program in Mozambique. Close collaboration with M&E specialists to develop additional indicators was necessary. All projects have now been assigned a results and monitoring specialist working with particular industries and sectors, and is therefore developing (or already has) expertise and experience in those areas. On the Lighting Africa program, the results measurement team (global and local) has worked to develop an entirely new framework based on an updated theory of change. The indicator framework is being piloted in Africa, and then will be shared globally for Lighting Asia and Lighting India.

For the Multilateral Investment Guarantee Agency (MIGA), in FY09-14, IEG evaluated or validated 18 investment projects and assigned mostly successful or higher rating to 11 projects (61 percent), which is in line with the MIGA average success rate of 63 percent.

## FINDINGS FROM THEMATIC, GLOBAL, AND CORPORATE EVALUATIONS

Meeting the goals of the Sustaining Energy for All (SE4All) by 2030 in Africa will require sharply increased funding from all sources, including the private sector. To scale up access to electricity in Africa, the increasing Bank support for electricity could be a catalyst for nontraditional funding of investments in the sector. The 2015 IEG evaluation *World Bank Group Support for Electricity Access (2000–2014)* cited good practice national access scale-up experiences worldwide that are relevant for Africa, including experiences in Vietnam, Lao Peoples Democratic Republic, Indonesia, and Bangladesh, as well as in Rwanda and Kenya. With Bank support, Rwanda and Kenya prepared the first sector-wide programs in the electricity sector, with national electricity access rollout plans using least-cost combinations of grid and off-grid electrification. These are showing better results than can be achieved using a project-by-project approach. After long periods of stagnation, access levels increased from 6 percent to 15 percent in Rwanda and 23 percent to 30 percent in Kenya. Strong government commitment for these rollout plans has fostered structured engagement of government, multilateral banks, donors, and private sector partners, leading to significant financing commitments. The private sector made commitments it may not have made without the sector-wide programs. On off-grid electrification, IEG cited Bangladesh and Mongolia as good practice cases. In particular, good practice experiences on off-grid solar home systems are especially relevant for several Sub-Saharan Africa countries in fragile situations, with dispersed populations, or whose sector conditions are not ready for systematic and rapid scale-up.

World Bank interventions for private sector development support policy, legal, and institutional reforms to create favorable market conditions for enterprises and enhance competitiveness. The 2009 evaluation *World Bank Group Support for Innovation and Entrepreneurship* highlighted the importance of the investment climate and competition for innovation, underpinning the critical role of investment climate operations for sustaining economic growth. The 2014 evaluation *Investment Climate Reforms: An Independent Evaluation of World Bank Group Support to Reforms of Business Regulations* noted that investment climate operations face the usual challenges to other World Bank Group projects, with implementation delays and the onset of a crisis the most commonly encountered problems. The analysis of the performance of investment climate interventions reveals that simple project design, good risk assessment, and supervision by the Bank are important to project outcomes, even alleviating the weaknesses of the borrower and the effects of a crisis. Success in fragile situations such as South Sudan and Liberia highlight that even in a post-conflict country with limited implementation capacity, a reform program can be successful with simple design, technical assistance, and strong government commitment. The evaluation noted the limited gender targeting in the investment

## APPENDIX E REGION UPDATES

climate portfolio and proposed that projects include gender-disaggregated indicators. Further, the assessment of the impact of regulatory reforms should be carried out on the society as a whole, not just on businesses.

Bank interventions promoting children's development were more evident for children three years and older, typically for three, four, five, and six year olds, late entry points to begin to stimulate children's language, cognitive, and socio-emotional development, according to the 2015 IEG evaluation *World Bank Support to Early Childhood Development*. IEG found that Bank sector strategies in health, education, and social protection feature early childhood development (ECD). These sector-based structures tend to seek entry points for engagement with countries in ECD with the corresponding public sector authorities. IEG found that country strategies are often light on ECD, with limited discussion of the ECD interventions embedded in their programs and suggested that ECD interventions should be properly integrated into the Country Partnership Frameworks. According to the evaluation, the positive correlation between analytical work on ECD and subsequent successful Bank operations, indicated the importance of analytical work in motivating successful interventions in ECD, particularly to meet the pressing needs in the Africa Region. IEG cited Mozambique where, following a presentation of dismal child development indicators from an impact evaluation of an ECD pilot, within a week the minister of education requested support for an ECD program. In Senegal, three nutrition-related knowledge products and one impact evaluation preceded five interventions in nutrition. The outcome as well as the borrower performance on two nutrition interventions in Senegal were rated highly satisfactory and satisfactory by the IEG, perhaps the only projects in Senegal to receive such high ratings in recent years.

IEG's evaluation *The Big Business of Small Enterprises – Evaluation of the World Bank Group Experience with Targeted Support to Small and Medium-Size Enterprises (2006–2012)* noted that with IFC support, MIGA's Small Investment Program projects achieved a successful outcome rating, notwithstanding their location in conflict-affected areas. The privatization of Hotel Independence in Burkina Faso is one such example; the hotel was able to turn around its performance after full renovation. To complement MIGA guarantees, IFC, Banque Ouest Africaine de Développement, and Bank of Africa provided loan financing. In Ghana, IEG found that IFC's role and contribution was essential to the development of leasing sector as IFC was the only player to engage with the leasing industry. Although some of the targeted legal and regulatory changes did not materialize by the time of project closure, leasing transactions and contracts increased dramatically. Lastly, in Nigeria, IFC provided its client bank a loan funding to on-lend to 300 women entrepreneurs, complemented by IFC Advisory Services to equip women entrepreneurs with

financial and business skills. IEG confirmed successful development outcome ratings for both Investment and Advisory Services with this Nigerian bank.

IEG's evaluation *World Bank Group Assistance to Low-Income Fragile and Conflict-Affected States* indicated that in Cameroon, the World Bank and IFC collaborated closely in the power sector, providing loans, guarantees, and investments to private power projects and capacity building to the relevant ministry. Access to power in Cameroon is 50 percent, compared with an average of 33 percent for Sub-Saharan Africa. To manage project-level risks in the country, IFC invested alongside other international finance institutions.

#### EVALUATION FINDINGS FROM COUNTRY PROGRAM PERFORMANCE IN THE REGION

The performance of country programs as articulated in Country Partnership Strategies (CPSs) in the Africa Region has been generally weak. IEG reviewed Completion and Learning Reviews (CLRs) in FY13–15 for 20 countries in the Africa Region and rated the outcomes of 10 of these programs moderately satisfactory or higher, while the remaining 10 were rated moderately unsatisfactory or lower (see table 7). The CLRs found general alignment of the CPS to the Poverty Reduction Strategy Papers (PRSPs) or relevant country medium-term development plans and generally in line with the assistance of other development partners, in many cases coordinated through a Common Assistance Framework.

A common feature of the less successful country programs was a lack of well-articulated development objectives and focused assistance programs. This often stemmed in part from complex CPS pillars that mix objectives with the details of the means to achieve the objectives. The first pillar of the 2007 Malawi CPS was: “improving small holder productivity and integration into agro-processing through improved irrigation and farming practices, improved market incentives for surplus production, strengthened integration and links to input/output markets, and established storage and mitigation measures for food security risks over time.” The second and third pillars were not any more succinct. The same is seen in the CPSs of Senegal, The Gambia, Mauritania, Zambia, and Guinea. These detailed pillars tend to hide the multiplicity of objectives and pillars, and give credibility to concepts that alone may not merit it. The approach hinders prioritization and selectivity, leading to complex and overambitious programming. It also hinders the development of simple and relevant results framework.

The pillars of better-performing programs are based on key development objectives and are succinctly presented. This facilitates the choice of feasible and impactful interventions in each pillar, leading to an overall program likely to meet the

## APPENDIX E REGION UPDATES

development objectives. For the Democratic Republic of Congo (DRC), the pillars were relevant and succinct: rebuilding state capacity to increase access and improve quality of basic services; creating conditions for growth and economic diversification; and improving access to health and education. The result framework was broadly appropriate although the outcome indicators relied mostly on the project level due to data deficiencies. Other cases of appropriate articulation of pillars include Burundi, Ethiopia, Kenya, and Liberia, with moderately satisfactory or higher outcomes ratings.

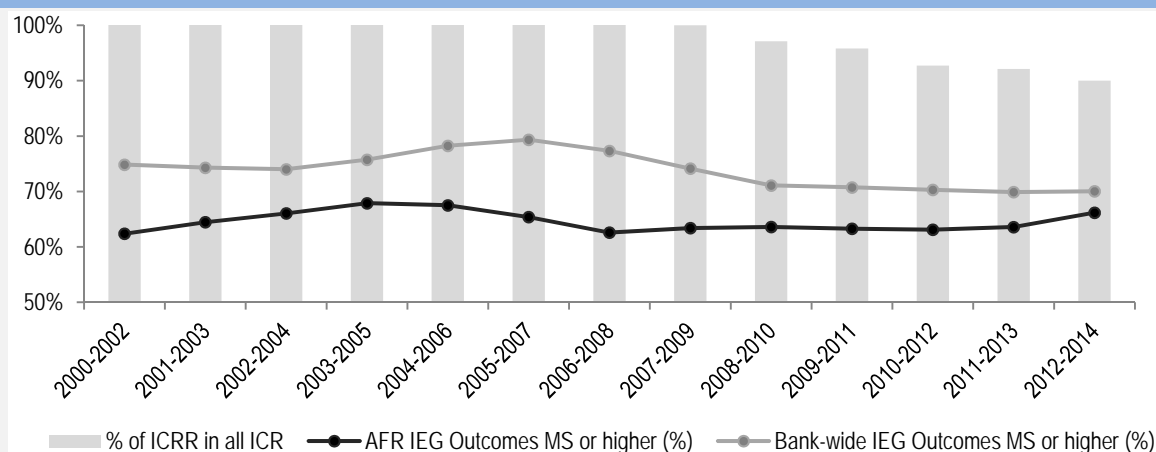

While poverty and economic diversification have been central to development strategies and planning in the resource-rich countries in Africa such as Zambia and Nigeria, the results have been disappointing. Sustained growth and economic and export diversification have proved elusive, with persistent reliance on the dominant extractive industry for government revenues and exports. There has been limited progress in reducing poverty, containing income inequality and creating employment. Zambia was one of four countries the IEG evaluation *World Bank Group Engagement in Resource-Rich Developing Countries: The Cases of the Plurinational State of Bolivia, Kazakhstan, Mongolia, and Zambia*. The focus of the Zambia CPS on macroeconomic and public financial management, investing in infrastructure, improving the business climate, and encouraging private investment was generally consistent with the evaluation's findings on the key drivers of progress on shared growth and diversification. However, results have been limited due to less than effective program implementation, IEG rated the Zambia FY08–12 CPS as moderately satisfactory on both outcome and Bank performance.

Risk assessment with relevant mitigation measures facilitates program design and appropriate responses to unanticipated developments. The CPS of the DRC identified eight major risks for engagement in the post-conflict country, and proposed mitigation measures following a three-pronged risk management strategy: (i) warning mechanisms: regular review and/or continuous monitoring for early detection of risks materialization; (ii) proactive response: scaling-down, redirection, revision, suspension and cancellation of IDA programs depending on the situation; and (iii) risk reduction mechanisms: interventions within the CPS program. The risk of economic fragility materialized in the context of the 2008/09 global financial crisis and the Bank acted flexibly by approving relevant emergency credits to support critical imports. It also responded to a malaria epidemic and polio outbreak with two tranches of supplementary financing to the health sector project. The Malawi CPS identified political and fiduciary risks as well as risks of drought-related vulnerability, and impact of HIV/AIDS on government capacity. In contrast to the DRC, the mitigation measures under the Malawi CPS were not specific, and involved actions with uncertain outcomes. For example, political risks would be

mitigated by more forceful engagement with parliament and civil society, while continuous engagement on reform and operational focus on improving governance would mitigate fiduciary risks. When the political risks materialized, Bank projects experienced significant implementation delays, including for the Agricultural Sector Program relied upon to address Malawi’s vulnerability to drought. In the Country Partnerships Framework (CPF) Progress Report several planned projects were dropped and replaced by new projects, presumably as a response to the heightened political risks although this was not formally planned as a risk mitigation action.

The CPF preparation process is important. Strong government commitment and engagement in this process, including a proactive role in selecting the areas and programs and projects for World Bank funding, would tend to reduce implementation risks. This was the case for Rwanda, the only country in the Africa Region whose program performance was rated satisfactory by IEG.

## East Asia and the Pacific

### REGIONAL CHALLENGES AND EVALUATION FINDINGS FROM WORLD BANK GROUP OPERATIONS IN THE REGION

East Asia and Pacific (EAP) comprises an exceptionally diverse client base in terms of income, resources, population size, and fragility. Extreme poverty has fallen faster in EAP than any other Region, and prosperity has been shared, but vulnerabilities persist. In FY15, the Region faced gradual moderation in Chinese growth, a positive impact from declining oil prices as most countries are net importers, and strong growth in Association of Southeast Asian Nations (ASEAN) countries except for Indonesia, Thailand, and Malaysia. The World Bank Group strategy for EAP had the goal of ending extreme poverty and boosting shared prosperity in a sustainable way. The intent was to address challenges of social vulnerabilities, urbanization and infrastructure, weak governance, constraints to growth and jobs, natural disasters, environmental degradation, and regional and national conflict.

New World Bank lending commitments in the Region trended slightly downward over the period with \$6.6 billion in FY12, \$6.2 billion in FY13, \$6.3 billion in FY14, and \$6.3 billion in FY15 (table 5). New commitments for FY15 are focused on Social, Urban, Rural and Resilience, Agriculture, and Water, in line with strategic priorities.

The Bank's lending operations performed somewhat below the Bank average in EAP, with 65 percent of projects that exited during FY12–FY14 rated moderately satisfactory or higher, compared to 70 percent World Bank-wide (figure 1). The difference is not statistically significant. This performance represented a decline from 75 percent moderately satisfactory or higher in the Region during FY09–11, which is statistically significant at the 10 percent level.

By Global Practice, EAP portfolio performance is higher than for the World Bank in Education, with 87 percent of evaluated projects rated moderately satisfactory or higher versus 81 percent Bank-wide. Performance is the same as the Bank average in Macroeconomic and Fiscal Management (63 percent) but lower in infrastructure (61 percent versus 67 percent in Energy and Extractives, 63 percent compared to 74 percent in Transports and Information and Communications Technology, and 50 percent versus 71 percent in Water) and in Governance (27 percent versus 57 percent) (table 1). In Social, Urban and Rural Resilience, project performance is higher than Bank average in net commitments (85 percent versus 81 percent Bank-wide) but lower in terms of number of projects (68 percent versus 77 percent) suggesting EAP's larger social resilience projects are more successful than the smaller one.

World Bank projects receiving favorable ratings had some notable strengths:

- They adopted measures that both improve the environment and develop more productive agricultural practices, which can be attractive to a community and give an incentive for sustaining both the environmental and agricultural improvements. For example, an evaluation of the China Changjiang/Pearl River Watershed Rehabilitation found that the operation contributed both to environmental protection and enhanced livelihoods, by directly benefitting both the local community and individual farmers and improving the environment – that is, most environmental actions were profitable. With their direct welfare at stake, farmers are likely to maintain the environmentally beneficial practices. In addition, technologies for watershed management that are simple and small-scale can have significant impact – on the environment and people’s welfare – without recourse to larger infrastructure. Likewise, planting orchards, minimum tillage, check-dams, terraces, pastures, and soil and water conserving agronomic practices improved incomes and the prospects for conserving soils.
- Support to reduce vulnerability to natural hazards should combine hard (such as infrastructure) and soft (such as early warning and institutional strengthening) investments. The Vietnam Disaster Risk Management project appropriately focused both on up-front measures to reduce vulnerability and actions to increase readiness to weather-related natural disasters. These interventions included the piloting of community-based approaches in areas prone to such events, and efforts to improve the post-disaster response to them when they occur, as well as strengthening the capacity of national and subnational (provincial, district, and commune) institutions to anticipate and to manage the response to natural hazards.
- For countries seeking to rebuild ties with the global economy, it is important to identify opportunities for reform that are not too complex or institutionally demanding but can still be transformative and gain wide social support. For instance, the Myanmar Reengagement and Reform project supported improvements in the exchange rate management system, one of the most visible signs of economic distortion and mismanagement. The program also aimed to increase real spending on core social and human development services that can generate popular support for reform. The design built on and derived lessons from other country experience with reengagement operations, for example in post-conflict situations, drawing on findings from the 2011 *World Development Report: Conflict, Security and Development*. In that regard, the focus was placed on core reforms emphasizing institutional transformation appropriate to the level of institutional capacity, country knowledge, and national context. Arrears clearance was handled quickly and jointly with the Asian Development Bank.

- There are potential synergies between reforms in one sector and those in another. The rice policy measures supported by the Philippines Global Food Resource Program DPO were grounded in the Bank's ongoing analytical work and policy dialogue on the rice sector, while those related to social protection and targeting drew on the Bank's analytical work, policy notes, and consultant studies on the issues of improved targeting, as well as on its Inclusive Growth Analytic and Advisory Activities (AAA) program that was underway during the DPO preparation. Supervision was carried out through related operations, in particular the Social Welfare Development Reform Project.

World Bank projects with unfavorable ratings had weaknesses that could have been addressed at the design stage:

- Careful design of unambiguous indicators, with baseline and target values, is critically important for adequate project monitoring and evaluation (M&E). The evaluation of the Manila Third Sewerage project found that proper attention needs to be paid to the procedures and institutional arrangements for M&E, including adequate training and motivation of concerned staff. In this case, there was frequent rotation of staff working on M&E and uncertainties regarding the quality of some of the data collected.
- Realistic project scope and goals increase the likelihood of project success, especially in situations where implementing entities have weak capacity. The actions to be undertaken under Indonesia Initiatives for Local Governance Reform were so detailed and complex, and the capacity of most districts so weak, that the feasibility of accomplishing all of them in 40 pilot districts (out of a total of 440 districts in the country) should have been assessed ex-ante. Also, separating responsibility for M&E from the implementing agency can reduce the likelihood of M&E uptake and use. Specifically, isolating the function can reduce the use of M&E results in project decision-making, an especially negative outcome for a pilot project such as this one. An alternative design would have been to include regular M&E activities within the purview of the main executing agency, reserving only a few key reports such as the mid-term and final evaluations for a separate, independent agency.

Twenty-six percent of projects that exited during FY12–FY14 had their M&E quality rated substantial or higher, compared to a Bank average of 29 percent (table 6). The difference is not statistically significant.

EAP Region management reports that it is taking actions to address performance challenges, particularly related to results and M&E. First, an ongoing piece of work

## APPENDIX E REGION UPDATES

is designed to: (i) analyze the underlying causes of poor project outcomes in EAP; and (ii) develop a methodology that uses readily available project monitoring indicators to identify projects rated moderately satisfactory that may be at risk of not achieving their outcomes. On the basis of the methodology developed, a series of desk reviews covering 42 projects identified across the Region's country management units (CMUs) were carried out to provide an independent perspective on how projects could improve their chances of achieving their intended outcomes. The findings of the reviews were shared with the Global Practice (GP) managers and task teams. Drawing from this work, the Region joined forces with the Vietnam CMU and with Operations Policy and Country services (OPCS) in carrying out a results and M&E operational program for operational staff consisting of three complementary activities: (i) results and M&E training workshop; (ii) results and M&E operational clinics; and (iii) M&E framework assessment at the level of the CMU. The Region plans to build on and expand these efforts in collaboration with OPCS, the GPs, and the CMUs. IEG will be able to assess the extent to which these measures help address performance challenges in EAP Region through future portfolio reviews.

The Region's success rate with International Finance Corporation (IFC) activities, by number of investment projects, fell short of IFC averages. For FY12-14, IEG validated 26 investment projects and assigned ratings of mostly successful or higher to 13 projects (50 percent), compared with an IFC average of 58 percent. By investment commitments, the Region's success rate was 75 percent, compared with an IFC average of 69 percent (table 2).

In this large and diverse Region, an integrated approach of Investment and Advisory Services enhanced the value of IFC's investments and contributed to the success of those operation. The Sichuan Earthquake Reconstruction Program is a good example. In that project IFC Investment and Advisory Service projects together helped to accelerate the flow of funds to small and medium-sized enterprises (SMEs) after a devastating earthquake.

When a small investment amount is planned, especially to a start-up subsidiary of a group client, IFC needed to structure an investment package for the whole group, an important lesson in Mongolia. In this Region, the risk often lies in not having the appropriate experience within the IFC team. A Coal Bed Methane development project suffered from a lack of IFC expertise in the technology and from not hiring an external consultant to regularly review the company's operations. The lack of expertise also made IFC slow in exiting from the company and resulted in a larger loss than might otherwise have been the case.

For IFC Advisory Services projects, during the review period, IEG validated 28 projects and assigned ratings of mostly successful or higher to 17 projects (61 percent), below the IFC average 64 percent (table 3).

In this Region, Advisory Services projects are often used to establish sector-wide benefits. A comprehensive private credit bureau project in Cambodia helped integrate banks and microfinance institutions into a mainstream credit reporting system. Strong commitments and cooperation from all entities in the sector was critical to the project success. If key Cambodian banks had decided not to participate, the project could have failed. Similarly, in China, IFC developed a village and township bank network through a “working group” approach that improved communication among all stakeholders and accelerated decision-making. For the Pacific Islands and small states, one of the challenges for IFC appeared to be keeping costs low. In Kiribati, where IFC mobilized private sector investment in a hotel, the Advisory Services experience seems to indicate that transaction costs can be reduced by hiring a reliable local consultant for due diligence and client communications.

#### FINDINGS FROM THEMATIC, GLOBAL, AND CORPORATE EVALUATIONS

The evaluation *The Poverty Focus of Country Programs: Lessons from World Bank Experience* (IEG 2015) found that during the past two decades, the Bank’s technical and financial support helped improve the quality of the Lao PDR Expenditure and Consumption Survey data, thus providing a strong information basis for poverty diagnostics in the 2000s. This work went beyond the typical analysis of poverty determinants. It examined more deeply the well-being of marginalized ethnic minorities, indigenous peoples, tribal groups, castes, and other excluded groups, using both income and non-income indicators and reviews of sociological and anthropological literature.

IEG’s *Learning and Results in World Bank Operations: Toward a New Learning Strategy* (2015) points to the importance of maintaining networks outside the Bank. In the Philippines where the nongovernmental organization sector is strong and well established, Bank staff participated in a local community of practice, helping to make community-driven development efforts work together better with another government program. Technical assistance and operational learning from both programs were regularly shared between staff in the Department of Social Welfare and Development and the Bank. Government-sponsored impact evaluations assessed how much the programs informed each other (Edillon, Piza, and Santos 2011). The pressure for coordination and cross-fertilization came squarely from the client’s side.

## APPENDIX E REGION UPDATES

The evaluation *Investment Climate Reforms* (IEG 2014) found that, before a recent reorganization of investment climate activities, coordination within the World Bank Group on reforms was mostly informal, relying mainly on personal contacts, which made IFC's Philippines Investment Promotion Policies Project inherently complex and controversial. Multiple Bank Group institutions were involved, including IBRD, CIC/FIAS, MIGA, and IFC, and the team members did not always share the same perspective. Although this was not the main factor behind the failure of the project, it certainly detracted from a good performance. On the bright side, the evaluation also found that, although investment climate reform support by the Bank Group generally focuses predominantly on reducing costs to businesses, in the Philippines, half the implemented interventions was also woman friendly.

*World-Bank Group Support to Public-Private Partnerships* (IEG 2014) reviewed regional projects as well as projects in China, the Philippines, and Vietnam. In addition to providing finance and mobilizing additional funding, IFC added value during due diligence or through its role as an honest broker. In public-private partnerships (PPPs), IFC has been helpful in several ways, in particular when it engaged in the early stage of project development. IFC's environment and safety guidelines provided comfort to the sponsor and reduced implementation delays, as was the case the North Luzon Expressway in the Philippines. In China, IFC introduced safeguards standards in the wastewater sector and structured the first waste-to-energy project. In the Philippines, IFC's Advisory Services project also succeeded in bringing to closure a utility privatization that had earlier been unsuccessfully attempted, by engaging with the regulator from the start and innovating financing that minimized risks to the potential sponsor. IFC also acted as advisor on high-profile transport projects, and in the non-grid areas, it took on challenging privatizations of small generators and successfully completed one.

### EVALUATION FINDINGS FROM COUNTRY PROGRAM PERFORMANCE IN THE REGION

Five CLR Reviews were completed during the FY13–15 period: three with outcome ratings of moderately satisfactory or higher and two rated moderately unsatisfactory or lower (table 7).

The outcome of the Philippines country program was rated moderately satisfactory (FY14 review). Three key lessons from are highlighted. First, progress on combating corruption, though slow, would benefit from a stronger government commitment at high levels. Such commitment would make it more likely to find champions that push for better governance in different sectors where the Bank operates. Second, progress in social protection in the Philippines is a good illustration of an area where Bank expertise adds value for its clients. Third, selectivity is critical to avoid thin

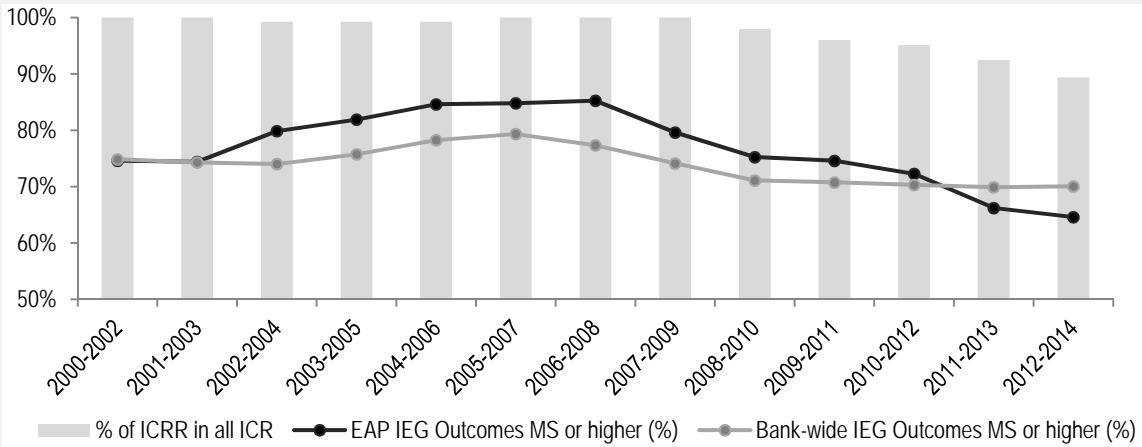

engagement and likely weak outcomes, as illustrated by comparing the strong engagement and results in areas such as disaster response with others where the Bank lost persistence or continuity, such as women's health. IFC made meaningful contributions to two areas – financial markets and infrastructure sector. In particular, IFC had helped boost investor confidence in the Philippines banking sector after the global financial crisis. In the infrastructure sector, IFC, together with the Bank, helped improve access to electricity in rural areas and strengthen electric cooperatives through joint effort of IFC Investment and Advisory Services.

The Indonesia country program outcome was also rated moderately satisfactory (FY13 review). Intensive support by the Bank Group and other partners for the tsunami reconstruction effort has helped build the institutions for assessing and responding to natural disasters; the effectiveness of which was demonstrated by recent events. Good progress has also been achieved toward setting up the mechanism for addressing deforestation, the main climate change challenge facing Indonesia, although the critical issue of interagency coordination for climate change management remains unaddressed. On the other hand, the emerging engagement at the local level to improve budgetary practices was frustrated by insufficient institutionalization of accountability arrangements among central, provincial, district and city authorities, which raises the issue of sustainability of the reform pilots. IFC's role in the country program focused on three of the five core engagement areas (Private Sector Development, Infrastructure, and Environmental Sustainability and Disaster Mitigation), with a program design that was relevant in varying degree to the program objective of building institutions.

The outcome of the Timor-Leste program was rated moderately unsatisfactory (FY13 review). Looking at the overall program, the evaluation found that attention should be given to three key points. First, while mainstreaming an issue (such as youth, gender, or governance) is increasingly used in country program design to highlight its importance, this often results in diluted attention during implementation, weak support, and no accountability for achieving results. It is thus critically important to devote at least as much attention to building a strong results chain for the cross-cutting themes such as youth employment as to any other pillars, and include them in the results framework for proper progress monitoring. Second, the risks that threaten the successful implementation of the Bank Group program may differ in important ways from the risks facing the country that the Bank Group program is designed to address. Confusing the two often lead to inadequate mitigation measures to deal with the risks to the World Bank program. Third, the results frameworks should be consistent with the institutional capacity for data collection and streamlined to include a manageable number of key outcomes to guide program implementation and help signal any needed adjustments.

## Europe and Central Asia

### REGIONAL CHALLENGES AND EVALUATION FINDINGS FROM WORLD BANK GROUP OPERATIONS IN THE REGION

With an estimated 2.1 percent GDP growth for 2015, Europe and Central Asia (ECA) is among the slowest growing of all Regions.<sup>1</sup> Poor growth prospects will make it harder to meet poverty and shared prosperity goals as gains that were made pre-2008 are being eroded in some countries.<sup>2</sup> Ongoing regional tensions and contracting economies have slowed Eurozone growth and affected trade and capital flows. Persistent social exclusion (of the Roma community for example), an aging population, high youth unemployment, and relatively low labor market participation exacerbate the challenges facing the Region. Many of the challenges may intensify given the recent refugee crisis, a spillover from unrest in the Middle East. To achieve the World Bank Group's twin goals of ending extreme poverty and boosting shared prosperity, the ECA strategy focuses on two pillars: (a) competitiveness and shared prosperity through jobs; and (b) environmental, social, and fiscal sustainability.<sup>3</sup> Under that strategy in the short-term, ECA is helping to support job creation, enhance social protection programs, and assist in public investment prioritization to improve resource allocation. Over the medium to longer term, the focus shifts to issues such as governance, enhancing the business environment, financial sector development, social inclusion and to climate resilience, pension reform, and lifelong learning.

Overall performance of World Bank operations in ECA is better than for the Bank as a whole: outcome ratings at exit FY12–14 were 74 percent moderately satisfactory or higher for ECA compared to a Bank average of 70 percent (figure 1).

By Global Practice, ECA Region portfolio performance is significantly higher than Bank average in infrastructure (Energy and Extractives, Transport and Information and Communications Technology, and Water), Macroeconomic and Fiscal Management (reaching 99 percent success in terms of net commitments) and Financial and Markets, but similar to the average in Social, Urban and Rural Resilience and or below average in Social Protection (table 1).

Rated projects in IDA and blend countries (79 and 91 percent moderately satisfactory or higher respectively FY12–14) performed better than those in IBRD countries in the ECA Region (69 percent moderately satisfactory or higher) (table 4). In many instances, performance in IDA countries was particularly strong – 12 of 15 projects in the Kyrgyz Republic were rated satisfactory or higher (80 percent) as were 4 of 5 projects and 11 of 12 projects in Kosovo and Tajikistan, respectively (80 percent and 92 percent, respectively) (table 4).<sup>4</sup>

## APPENDIX E REGION UPDATES

In line with findings in this and earlier RAP reports, portfolio performance could be improved further with better project preparation – most projects with less than satisfactory outcomes were also rated less than satisfactory for quality at entry. Common weaknesses in less successful projects include overly ambitious objectives relative to project components or time frame, overly complex project design involving multiple components and implementing agencies, and overestimation of client buy-in and system capacity. On the other hand, a good results framework defined through a clear logical sequence between project activities, output, outcomes, and development objectives is a common feature among successful projects. The RAP series and other IEG evaluations have found that successful projects demonstrate the project team’s willingness to learn from past projects noting that, to add value, learning must always be tailored to the local context. So, while the design of the Bukhara and Samarkand Water Supply Project was based on the Bank’s positive experience in Nepal, India, and Peru, it overlooked the lack of a community self-help culture and state dominance in decision-making in Uzbekistan.

With a monitoring and evaluation (M&E) rating of 35 percent substantial or higher, ECA performs above the Bank average (29 percent) indicating relative success but still low levels of satisfaction with M&E design, implementation, and utilization in FY12–14 (table 6). A series of perennial issues are evident, including: over-reliance on output indicators and a lack of outcome indicators; use of indicators not directly relevant to project objectives, or not directly attributable to project activities; and, a lack of baseline data that precludes measurement of progress.

International Finance Corporation (IFC) investments in ECA, a region severely affected by the global financial crisis, performed worse than the overall average – a 48 percent success rate by number, and a 58 percent success rate by commitment in ECA compared, respectively, to 58 percent and 69 percent success rates overall (table 2). Key learning from a number of investment projects, including real estate development transactions, was that the strength of sponsors needs to be thoroughly evaluated. In a greenfield micro, small, and medium enterprise project in Belarus, absence of a clear, strategic sponsor that was willing to drive and support the venture led to unsuccessful development outcome. On the other hand, where there was a strong alignment with sponsor interest, IFC was able to maximize developmental impact for an energy efficiency-related leasing project in Turkey.

IEG validated 32 IFC Advisory Services projects over FY12–14 and assigned mostly successful or higher rating to 23 projects (72 percent), which was above the IFC average of 64 percent (table 3). Based on IFC experience with Advisory Services projects for public-private partnerships (PPP), which more countries in ECA may elect to use given increasing fiscal deficits, one key to success was to market the

project to a wide set of investors. This worked for a project in Central Asia, where a large number of prospective investors maximized competition to achieve better outcome for the client, and improved chances of securing a valid and acceptable offer. In Kosovo, IFC was able to improve the quality of complex transactions through engaging with investors at the earliest possible stage, to understand better the regulatory and financial issues to be addressed. In the case of an electricity sector PPP in that country, a small, dedicated unit within the administration also helped. In other cases, low capacity within the government or municipality has to be addressed first. As it became evident in a solid waste management project in Albania, it may be better to aim to improve their capacity first before creating the investment opportunities.

The Multilateral Investment Guarantee Agency (MIGA) guarantee projects in the Region performed less well than MIGA projects overall. For FY12–14, 57 percent (13 projects) of 23 guarantee projects rated by IEG were rated mostly successful or higher, which was below the MIGA average of 63 percent.

#### FINDINGS FROM THEMATIC, GLOBAL, AND CORPORATE EVALUATIONS

According to IEG's *World Bank Support to Early Childhood Development* (2015), core need and relevant Bank activities are concentrated in Regions other than ECA, particularly the Africa Region; however, the evaluation addresses issues that are of more general relevance and importance to ECA, including to the social sustainability aspect of the Region's second strategic pillar. The evaluation finds the World Bank's support to early childhood development (ECD) is well aligned with the Bank's twin goals and advocates, going forward, for the Bank to build a strategic framework and an organizational structure to support a coordinated approach across Global Practices toward the development of children.

Bulgaria was selected for desk-based case study review. The evaluation found Bank support to be highly consistent with government reform policies, and that lending activities provided important short-term support to the government in solidifying its child welfare reform and social inclusion agendas. Project interventions incorporated limited integrated approaches, primarily through preschool education programs that provide basic health screening, supplemental meals, and targeted income support (although there is no explicit ECD strategy or inter-sectoral collaboration mechanism). A key message from the evaluation relevant to the Region is that improved and more sustainable outcomes in child development can be achieved through an integrated and joint approach to ECD.

## APPENDIX E REGION UPDATES

The *Poverty Focus of Country Programs: Lessons from World Bank Experience* (IEG 2015) examines how, and how well, the Bank Group has focused its support on poverty reduction over the past decade. It finds that: (i) the Bank can better perform its role in supporting and reporting global poverty data, and producing high-quality poverty diagnostics (for example, through investing more in sustainable data collection); (ii) high-quality and timely diagnostics, policy dialogue, and technical assistance should help identify entry points and lay the groundwork for greater impact, particularly where country priorities do not reflect World Bank Group goals; and (iii) strengthening complementarity among diagnostic work, technical assistance, and lending instruments, can help scale up efforts and achieve more sustainable, long-term impact. Romania was selected as a case study country.

The Bank has a long-standing engagement on poverty in Romania, including direct engagement in social protection and health services operations, as well as support to data collection and the development of poverty indicators. The FY06–09 country strategy articulated poverty-related outcome targets covering, for example, extreme poverty, and youth unemployment. The social inclusion pillar of the FY09–13 strategy includes monitored project targets, covering the living conditions of Roma and the targeting of social assistance. Going forward, more systematic measurement of poverty impacts could strengthen the feedback loops that help inform the poverty content of new programs and operations.

IEG's evaluation of *World Bank Group Engagement in Resource-Rich Developing Countries* (2015) highlights the broader financial sector issues in resource-rich countries. In Kazakhstan, IFC supported the financial sector during the financial crisis in 2008 through re-capitalization of systemic banks, providing higher risk financial instruments of equity and subordinated loans to improve the capital adequacy of client banks. Increasing liquidity in the banking sector because of growing resource rents often carries the risk of questionable investments, for example, in real estate. The story is different for the petroleum sector where the Bank and IFC's early engagement in petroleum projects in Kazakhstan helped to successfully update enterprise, environmental and social policies and procedures, introduced sophisticated pollution abatement technologies, and cleaned up past damage.

The IEG evaluations *Investment Climate Reforms: An Independent Evaluation of World Bank Group Support to Reforms of Business Regulations* (2014) and *The Big Business of Small Enterprises: Evaluation of the World Bank Group Experience with Targeted Support to Small and Medium- Size Enterprises, 2006–12* (2014) point to the need for better coordination within the Bank Group. In relation to investment climate reform, the Bank Group succeeded in helping to enact laws, streamlining process and time, and

providing simple cost savings for private firms, but the impact on investment, jobs, business formation, and growth was not clear, pointing to the need to expand the coverage of current diagnostic tools and integrate them to produce comparable indicators and develop a differentiated approach to identifying the economic and social impact of regulatory reforms. In relation to small and medium-size enterprises (SMEs), the evaluation found the World Bank Group lacks a clear, strategic approach – such an approach needs to be more firmly rooted in a clear, evidence-based understanding of what distinguishes an SME, and how the proposed support would remove constraints to the ability of SMEs to contribute to employment, growth, and economic opportunity in developing economies.

#### EVALUATION FINDINGS FROM COUNTRY PROGRAM PERFORMANCE IN THE REGION

The outcomes of Bank Group country programs in ECA remain positive. Country outcomes were rated moderately satisfactory or higher in 50 percent of IEG CLR Reviews in FY13 (2 reviews completed) before increasing to 100 percent moderately satisfactory or higher in FY14 (7 reviews completed) and staying at that level in FY15, though only 2 CLR Reviews for ECA countries (Albania and former Yugoslav Republic of Macedonia) were completed FY15, and the outcome rating for each is moderately satisfactory (table 7). Both FY15 CLR Reviews highlight the importance of maintaining ongoing dialogue with government and other stakeholders, exercising selectivity, and simplifying the results framework, particularly where implementation capacity is limited. The performance of projects rated in both countries broadly reflects respective country ratings. One project in Albania, the Secondary and Local Roads project, was rated highly satisfactory. The project surpassed targets through “crowding in” donor resources, connecting 86 communities through the rehabilitation of about 1,700 kilometers of local roads and the construction about 119 kilometers of new local and secondary roads. The Bank also successfully supported institutional developments aimed at improving roads management and introducing innovations in maintenance, thereby enhancing sustainability.

The Bank Group strategy for FYR Macedonia was relevant and well aligned to support faster, more inclusive, and sustainable growth while assisting the country prepare for accession to the European Union; however, the duration and depth of the Eurozone and broader global economic crises required a change of course that was not reflected in the (overly detailed) results framework, or in changed objectives as part of the Progress Report, resulting in a growing disconnect between stated and implied objectives. Nonetheless, the Bank response to changed circumstances with a more than doubling of the lending program was appropriate. The contribution of IFC Advisory Service projects to reducing trade constraints and facilitating

## APPENDIX E REGION UPDATES

privatization was also positive. The Bank Group strategy for Albania was also relevant and well aligned. The CLR Review comments on a strong focus on portfolio implementation, close partnership with donors and excellent use of advisory services and analytics (ASA). As in the case of FYR Macedonia, the results framework for Albania was overly elaborate and it suffered, in particular, from a lack of measureable indicators associated with IFC and joint Bank/IFC activities.

FY15 CLR Reviews bring out lessons for ASA in ECA. Perhaps the most important lesson is the need for broad consultation and the key role of ASA in building stakeholder support for progressive change. In Albania, the Bank produced a number of high-profile and high-quality analytical reports and undertook a number of ASA activities, using both Bank budget resources as well as donor funding from trust fund and other sources. This included, for example, analytical work and technical assistance in pension reform. The Bank's Policy Notes were well informed by strong stakeholder consultation, and were an important factor in establishing a strong dialogue with the new administration. Other work (such as a Country Economic Memorandum, Debt Management Assessment, and a technical assistance activity for Financial Sector Contingency planning) contributed to Albania's response to Eurozone developments and provided the basis for building stakeholder consensus on relevant progress.

IFC had 15 active Advisory Services in Albania during the Country Program Framework period valued in excess of \$17.3 million (6 of these were regional in scope in which case expenditure stretched beyond Albania). IEG evaluations found successful development effectiveness for Albania's International Standards and Technical Regulations, and for a project dealing with Alternative Dispute Resolution. The ASA program in FYR Macedonia was less intensive although the CLR Review notes the Bank's planned work on Water Sector Assessment and Green Growth and Climate Change was influential. IFC implemented three Advisory Services projects for a total of \$3.5 million in committed funds.

*A Country Program Evaluation (FY04–13) of Kazakhstan* (IEG 2015) carried out as part of a clustered country program evaluation on resource-rich countries found that impressive economic growth and rising hydrocarbon prices helped the country make steady progress on poverty reduction and social development during the review period; however, certain systemic issues – lack of progress on economic diversification and anticorruption, the dominant role of the state in the economy, low skill levels in the labor force, and a legacy of environmental issues – remain to be addressed. The World Bank Group has performed exceptionally well in its engagement with government, providing timely and trusted high-quality technical and policy advice, although the demand-driven nature of this engagement provides

little opportunity for the Bank to push the boundaries in defining strategic priorities. Looking forward, the Bank Group will need to advance transparency and accountability through engagement with a wider range of stakeholders, bringing them deeper into the conversation regarding ongoing progress. In line with its global development mandate, and to counteract possible limitations on defining priorities linked with the current emphasis on Reimbursable Advisory Services, the Bank should consider (re-) introducing standard, regular pieces of country diagnostics (for example, governance, anticorruption, and poverty assessments and Public Expenditure Reviews).

<sup>1</sup> World Bank Group. 2016. Global Economic Prospects: Spillovers amid Weak Growth. Washington, DC.

<sup>2</sup> Since 2008, the poverty rate has increased in, among others, Albania, Romania and FYR Macedonia, (ibid.)

<sup>3</sup> ECA Regional Update 2015.

<sup>4</sup> Noting the small number of projects in each instance, performance was well below the regional average (75 percent moderately satisfactory or higher) in Turkey (50 percent moderately satisfactory or higher), and Moldova (64 percent moderately satisfactory or higher). These two countries accounted for about 20 percent (n=8) of the poorly performing projects in the ECA Region FY12-14.

## Latin America and Caribbean

### REGIONAL CHALLENGES AND EVALUATION FINDINGS FROM WORLD BANK GROUP OPERATIONS IN THE REGION

The Great Deceleration has hit the Latin America and the Caribbean Region the hardest reflecting receding tailwinds and highlighting structural weaknesses. The gains of the last decade that saw declines in extreme poverty and income inequality in most countries are under threat. Certain areas, like the Caribbean, remain in chronic low growth and high debt and are vulnerable to economic shocks and natural disasters. The Regional Strategic Framework makes fiscal policies an anchor to the priority areas of engagement: infrastructure, education and health, private sector development and jobs, social protection, and environmental and social sustainability. The Region has moved to implement the new Systematic Country Diagnostic and Country Partnership Framework process and during FY15 presented three CPFs to the Board.

Lending in the Region reflects the Strategic Framework. Lending of \$6.0 billion during FY15 was higher than in 2014 (\$5.1 billion) but still less than the peak in 2011 (table 5). Macro and fiscal, at \$1.8 billion accounts for the largest share of lending. Lending to education increased from \$39 million in 2011 to \$751 million in 2015 in line with corporate priorities. Lending in health, nutrition, and population as well as in social protection increased in 2015 relative to 2014. Infrastructure lending (energy, transport, and water) remained steady and high.

The percentage of World Bank projects rated moderately satisfactory or higher for achievement of development outcomes over the FY12–14 period was higher than the Bank average (figure 1). The variation in ratings across Global Practices (GPs) within the Region over the FY12–14 period is wide (table 1). Out of 13 GPs, 6 rate over 80 percent for moderately satisfactory and higher, while energy, water, and governance are below 65 percent. The discrepancy between Latin America and the Caribbean and the global ratings is notable for several GPs. Agriculture, energy, and water fell short of the global average, while macroeconomic and fiscal management, environment, finance, governance, transport, and education were above it. As to countries with three or more projects evaluated during FY12–14, performance was low in Brazil and Honduras (50 percent or below rated moderately satisfactory or higher) and high (85 percent or above) in Colombia, Mexico, Peru, Dominican Republic, Nicaragua, and Uruguay (table 4). There is no significant difference in ratings between IBRD and IDA countries. IEG ratings of project monitoring and evaluation (M&E) quality is at 29 percent substantial, the same as the Bank-wide average (table 6). However, within the Region, there is a wide discrepancy in M&E

## APPENDIX E REGION UPDATES

ratings between IDA countries (16 percent substantial) and IBRD countries (36 percent substantial).

Lessons from projects rated satisfactory for outcomes highlight government leadership in implementation, strong dialogue and consensus building, and focused interventions that work through existing institutions. In Mexico, timely Bank response through support to *Oportunidades* project helped design a second generation of conditional cash transfers (CCTs) that shifted from an earlier project focus to a systemic approach with a broader view of social assistance. A strong institutional leadership in Mexico and the support of a rigorous impact evaluation agenda to gain legitimacy facilitated the shift. The choice of a Specific Investment Loan rather than a Development Policy Loan (DPL) contributed to a tighter engagement in operational details. In the Nicaragua Land Administration project, the building of a broad social consensus, strong political commitment, and working local governments contributed to the achievement of development objectives. IEG drew the lesson that, “strong focus on local governments is critical to the sustainability of investments in cadaster and registry modernization.” IEG Implementation Completion Report validations also highlight that rapid preparation is not an impediment to satisfactory performance if the designs are simple, effective, and focused and work with existing institutions so as not to overstress them. Examples are Argentina Prevention and Management of Influenza-Type Illness and Strengthening of Epidemiological System and the Organization of Eastern Caribbean States (OECS) Hurricane Thomas Emergency Recovery Loan.

Lessons from projects rated as unsatisfactory caution against complex designs that engage multiple actors, lack of precise and measurable outcomes, and disregarding country and sector implementation environment. Designs that rely on intensive inter-institutional coordination risk poor delivery, such as the Mexico Results-Based Management and Budgeting project and Costa Rica Puerto Limon project. When these projects faced implementation bottlenecks, restructuring was difficult because the original design did not take into account the legal requirements for restructuring public projects. A similar situation occurred in the Argentina Renewable Energy Rural Markets project, where the rigidity of design in a risky environment led to time-consuming restructuring that taxed performance. Lack of precise, clear, and measurable development outcome targets that can realistically be achieved by the project impaired adequate monitoring and implementation as in Guatemala’s Second Rural and Main Roads project and Colombia’s Antioquia Upper Secondary Education project. In these projects it was difficult not only to track performance but also to draw valuable lessons. An important message that comes across is the need to align project design to difficult country or sector implementation environments. For example, Bahia’s Poor Urban Areas Integrated Development project was

impaired by changes in local government and low capacity to manage the evolving environment and Haiti's Electricity project was impaired by poor institutions in the sector. Brazil Recife Urban Development and Social Inclusion project long preparation time weakened the commitment of the government. In small states, it can be difficult to gather sufficient information to access risks, which derailed Grenada's Public Sector Modernization Technical Assistance project.

Lessons from recently completed Project Performance Assessment Reports (PPARs) provide additional insights on drivers of performance. A disconnect between ambitious objectives and pilot interventions that lack a scaling up framework risks failure. The PPAR notes, "the project's official objectives were stated in terms of ambitious global environment objectives. But the project was designed as a pilot to meet the de-facto objective of providing the State of São Paulo with the capacity and tools to tackle future restoration, as opposed to being designed to meet its actual declared objective statement and it did not include intermediate outcomes that could enable an assessment of the likelihood of meeting longer term expectations." The importance of being selective and realistic about what can be achieved in the context of a sectoral DPO is stressed by Brazil's PPAR for the First Programmatic Reform Loan for Environmental Sustainability project (FY15). IEG points out, "considering that this was the first DPO series in Brazil focused on the environment, the complexity of the issues, and the many government agencies that they involved, the World Bank and the borrower needed to be more cautious about program design and policy reform priorities, in order to avoid being overly ambitious, as was evident with the 15 different policy areas of the Environment PRL." The PPAR for St Lucia Economic and Social Development DPL (FY14) finds the single tranche design unsuited to address both short and medium-term challenges the country faced and suggests being more forthcoming when the main objective is macroeconomic and fiscal support.

The International Finance Corporation (IFC) in Latin America and the Caribbean is performing above the global average on investment projects. For FY12-14, IEG validated 57 investment projects and assigned mostly successful or higher rating to 37 projects (65 percent), slightly above IFC average of 58 percent (table 2). By investment commitments, the Region's success rate of 76 percent was also above IFC average success rate of 69 percent. A relative scarcity of alternative financing in some countries in the region provided IFC with the opportunity of working with top-tier sponsors that helped mobilize additional lending and advance social goals, as was the case with an oil and gas investee on gender-focused hiring and training program, and regional health and social programs. Regional Funds contributed to risk diversification in countries where certain economic risks are endemic.

## APPENDIX E REGION UPDATES

During the review period, IEG validated 28 IFC Advisory Services projects and assigned mostly successful or higher rating to 18 projects (64 percent) in line with IFC global average of 64 percent (table 3). In LAC, which enjoys considerable human resources in many countries, evaluating what resources and skills are available locally before carrying out planned tasks helps improve delivery, as it happened in a subnational Doing Business project in Colombia. For small countries, where a project is often multi-country and multiproduct, local consultants help stay close to implementation and maintain momentum.

For Multilateral Investment Guarantee Agency (MIGA), for FY09–14, IEG evaluated or validated eight investment projects and assigned mostly successful or higher rating to five projects (63 percent) that was equal to MIGA average.

### FINDINGS FROM THEMATIC, GLOBAL, AND CORPORATE EVALUATIONS

The recommendations of *Poverty Focus of Country Programs: Lessons from World Bank Experience* (IEG 2015) are relevant to current efforts at protecting the gains of the past decade and making further inroads toward the twin goals in Latin America and the Caribbean. An in-depth look at Guatemala and Peru identified as a challenge moving from good analytical work to having impact on poverty. IEG found in Guatemala that excellent Bank support to the generation of poverty data and to the preparation of poverty diagnosis had only a limited impact on the country program, which over-relied on DPOs focused mostly on fiscal matters. In Peru, to the contrary, the contribution of the Bank to good poverty data and analysis since 1985 has been well reflected in the design of country strategies. The Bank capacity to mobilize a team of experts on poverty with high levels expertise and commitment was a success factor because it helped deliver strong and innovative analytical work, supported a high-quality policy dialogue, and generated trust.

*Learning and Results in World Bank Operations: Toward a New Learning Strategy* (IEG 2015) highlights Latin America and the Caribbean global and regional role in knowledge sharing. The evaluation emphasizes cooperation between Latin America and the Caribbean and Africa on social assistance and the contribution of this cooperation to more effective social assistance systems. The Bank work on CCT across sectors in Mexico and as a knowledge broker among Latin American countries contributed to knowledge sharing and sharper inclusion strategies.

Lessons from the IEG evaluation *World Bank Group Support for Electricity Access, FY2000–FY2014* (2015) are relevant to the Region, given weak sector performance. The recommendation to focus dialogue not only on investment projects but also on sector-wide policy and institutional issues is relevant given the weak project

performance seen in Argentina’s Renewable Energy Rural Markets project, Haiti’s Electricity project, and Bolivia Decentralized Electricity for Universal Access project. Latin America and the Caribbean energy projects reviewed over FY12–14 underperformed compared to the Bank average (57 percent moderately satisfactory or higher versus 67 percent) relative the average for all projects in the Region (76 percent moderately satisfactory or higher).

*World Bank Group Support to Public-Private Partnerships: Lessons from Experience in Client Countries (FY2002–FY2012)* (IEG 2014) found that, in Brazil, IFC advisory work increased international participation, and lowered tariffs. A number of IFC PPP Advisory Service projects were financed under the Brazilian Private Sector Partnership Program, a partnership of IFC, the Brazilian Development Bank (BNDES), and the Inter-American Development Bank. Since BNDES has been the dominant player for financing infrastructure projects, including PPPs, IFC’s engagement with BNDES was important to transfer knowledge of structuring PPPs and project finance transactions. IFC Advisory Services also successfully helped introduce “performance-standard” contracts to PPP transactions for highway and hospital projects, as well as the Equator Principles and IFC’s Social Standards for expropriation and resettlement rules.

#### EVALUATION FINDINGS FROM COUNTRY PROGRAM PERFORMANCE IN LATIN AMERICA AND THE CARIBBEAN

IEG Completion and Learning Review (CLR) validations rate development outcome of Country Partnership Frameworks as mostly satisfactory. Eleven CPFs were completed and reviewed during the FY13–15 period. IEG rated 10 as moderately satisfactory on development outcomes and only one was rated as unsatisfactory (table 7). On Bank performance, five CPFs were rated as fair, and six as good, moderately satisfactory, or satisfactory. IEG rated only five CPFs for IFC performance, of these one was fair and the rest either good, moderately satisfactory, or satisfactory.

The design of good results frameworks remain a challenge; notably, they still do not properly incorporate the efforts of IFC and MIGA. In IEG’s view Paraguay’s CPF objectives were so dispersed that they did not constitute a strategy and in the Dominican Republic the objectives were mostly aspirational and weakly linked to the program. Also, IEG CLR validations find that results frameworks did not reflect well the work and contribution of the IFC. In Costa Rica, IFC’s contribution through, for example, financing for renewable energy generation projects, were not reflected in the corresponding results framework, preventing full recognition in the CLR. In Panama, although not captured in the results framework, IFC and MIGA financed infrastructure investments that are enhancing Panama’s competitiveness (expansion

## APPENDIX E REGION UPDATES

of the Panama Canal, hydropower investments, and financial sector investments). MIGA, in turn, supported urban mobility through two guarantees issued to commercial banks for the construction of Metro Line One in Panama City.

Country teams in Latin America and the Caribbean are not availing themselves of the opportunity to revise and update programs and results frameworks. Overall IEG finds that country teams have not been using progress reports to adjust program and results frameworks. For instance, Panama's CLR IEG validation notes, "changes in the program have to be reflected in the results framework" to facilitate a flexible approach. IEG notes further, "that although the progress report was expected to be a significant exercise, it appears to have been a missed opportunity to attempt to modify and strengthen key interventions."

It remains an issue how to access and incorporate ownership into program designs. Some CLR validations emphasize the need to go beyond the government commitment at entry and assess the likelihood of implementation. On Guatemala, IEG notes, "considering the likelihood of achieving results, attention should go beyond formal government commitment and consider the factors that may block achieving the results, such as the difficult political economy in Guatemala." In Mexico, IEG found that a demand-driven approach to strengthen ownership unnecessarily led to a weak statement of CPF objectives. It highlights, "a key deficiency of the CPF was the notion that a flexible and client-driven strategy would not benefit from an analysis of the Bank Group's comparative advantage and a clear articulation of the specific CPF objectives within the country's long-term strategy." In IEG's view, "the lack of clear CPF objectives deprived the Bank Group of a management tool for managing risks and accounting for results."

IEG CLR validations find that analytic and advisory activities (AAA) is often dispersed, not well disseminated and not well connected to the objectives of the program. On Paraguay, IEG notes, "the Bank's high-quality economic and sector work needs to be disseminated effectively to have impact and build much needed constituency for reform." On Costa Rica, IEG calls for "a strategic AAA with more impact."

IEG's evaluation of *World Bank Group Engagement in Resource-Rich Developing Countries* (2015) highlights in Bolivia the importance of adapting programs when the Bank Group view on development differs from the sovereign vision of a state-led economy. It questions the effectiveness of remaining engaged in the country in areas of limited traction, where the reputation of the Bank may be at risk, and, instead, calls for the use of analytic work to stay current. IEG's view is that IFC could have been more successful by taking a long-term engagement approach and adapting its

products and processes to respond to the market demand of countries like Bolivia. Brazil's Country Program Evaluation (CPE) questioned whether the use of a few very large operations with high opportunity cost relative to the IBRD exposure limit was appropriate in view of the poor project performance.

## Middle East and North Africa

### REGIONAL CHALLENGES AND EVALUATION FINDINGS FROM WORLD BANK GROUP OPERATIONS IN THE REGION

The Middle East and North Africa Region's progress on the twin goal indicators has been good, but this masks the challenges of the Region's development model. Middle East and North Africa faces the triple challenges of severe macroeconomic imbalances, long-standing economic distortions, and fragility and conflict. In response, the Bank issued an update to its Middle East and North Africa Regional Strategy in 2013, with a focus on renewing the social contract in three areas: promoting opportunities through skills enhancement, improved business regulations, and greater inclusion; enhancing quality services through modernizing institutions, making them more accountable, and building on local success stories; and increasing citizen engagement through access to information, consensus building, and beneficiary feedback.

New World Bank lending commitments in the Region have steadily increased over the period from \$1.5 billion in FY12 to \$2.1 billion in FY13, \$2.8 billion in FY14, and \$3.5 billion in FY15 (table 5). New commitments for FY15 focus on Energy and Extractives; Social Protection and Labor; Social, Urban, Rural and Resilience; and Water, in line with the regional strategy.

The Bank's lending operations performed at a somewhat lower level in Middle East and North Africa than in other Regions, with 64 percent of projects that exited during FY12–14 rated moderately satisfactory or higher, compared to the Bank average of 70 percent (figure 1), but the difference is not statistically significant. The gap has continued to narrow since FY08–10.

By Global Practice, MNA portfolio performance is much lower than in the rest of the Bank in Macroeconomic and Fiscal Management, especially when considering net commitments; only one small project (\$40 million) out of four evaluated projects totaling \$910 million was rated moderately satisfactory or higher (table 1). Regional portfolio performance in Finance and Markets at 75 percent of the number of projects or 91 percent of net commitments rated moderately satisfactory or higher was not significantly different from the Bank average, respectively 73 percent and 93 percent. Performance in Education was significantly lower than Bank average (36 percent versus 67 percent Bank-wide). In Social, Urban and Rural Resilience one smaller project out of six did not perform well. Thus, in terms of net commitments, MNA portfolio performance is higher than Bank average (87 percent versus 81 percent).

Twenty-eight percent of projects that exited during FY12–FY14 had their monitoring and evaluation (M&E) quality rated substantial or higher, compared to a Bank average of 29 (table 6). The difference is not statistically significant.

Projects receiving favorable ratings had the following strengths:

- **In an emergency, project design should be kept simple and manageable.** Iraq Dokan and Derbandikhan Emergency Hydro Power had simple components, designed as the first stage of a longer-term rehabilitation effort of the identified hydropower plants. In addition, appropriate capacity should be ensured in the implementing agency, and physical proximity to the project site where possible.
- **Sustained coordination among state entities and donors is central to producing results.** Morocco’s Solid Waste Sector DPL saw the creation of national institutions at central and municipal level to oversee the growth of the sector. Donors provided the training needed to ensure technical and financial management of the sector.
- **Effective implementation and supervision can mitigate the impact of initial design weaknesses and delays.** Yemen Groundwater and Soil Conservation used a systematic approach to move communities toward comprehensive reductions in water consumption and effective management of aquifer depletion.
- **Strong design can lead to high achievement despite high risks.** Djibouti Health Sector Development focused on specific areas that would have significant impact on the quality of health services, such as emergency obstetrics, expansion of the number of paramedics, and establishment of a drug fund. The activities were to be implemented in all urban health facilities, which were accessible to 80 percent of the population. While initially assigned a high risk rating, most risks did not materialize or were mitigated through government commitment and effective Bank supervision.
- **M&E can be an effective management tool to support effective implementation.** Tunisia’s Export Development II found that that assisted firms had significantly higher annual export growth than control firms, based on two independent impact evaluations of the Second Export Market Access Fund supported by the operation. Conducting rigorous impact evaluations was possible even under the difficult circumstances of the 2010 revolution and its aftermath, circumstances that included many changes of heads of the implementing agencies.

Projects with unfavorable ratings had weaknesses such as the following:

- **Ambition should be in line with government implementation capacity.** Jordan Social Protection Enhancement did not accurately incorporate the views of the various agencies, who were unprepared for this type of project. In addition, the Bank's focus on means-tested targeting was not flexible and the Bank did not address the government's concerns with this method, hence reducing government ownership.
- **Outcome oriented M&E is crucial.** Iran Alborz Integrated Land and Water Management had several good indicators for monitoring impacts such as water quality and sediment yield, but not for assessing actions and impacts related to integrated water resources management. Not focusing on these results hindered achievement, already difficult because of sanctions on trade, and international flow of funds, and the halting of Bank missions.
- **Infrastructure reform needs enough time and supporting activities to address challenging political and social conditions.** Lebanon Ba'albeck Water and Wastewater underestimated weakness in the demand for connections to the new water supply network including a high prevalence of illegal connections to the old network, the collapse of civic controls as a result of instability, and distrust of government among the local population.

#### IFC AND MIGA OPERATIONS

In the case of the International Finance Corporation (IFC), the success rate in the MNA Region, by number of investment projects, was above IFC averages. For FY12-14, IEG validated 16 investment projects and assigned mostly successful or higher rating to 10 projects (63 percent), which was slightly higher than IFC average of 58 percent (table 2). By investment commitments, the Region's success rate was 42 percent, which was below IFC average success rate of 69 percent.

In this Region, where the middle class has remained stagnant and the refugee crisis had a spillover effect on many countries, two key IFC strategies to reduce infrastructure gaps were to focus on consumer affordability and to make the region more appealing to investors, both domestic and foreign. This was the main learning from an electricity distribution project in Jordan. Similarly, experience on a leasing investment in Algeria indicated that increasing access to finance requires partnering with a tried and tested sponsor *and* a careful review of the capacity of a financial institution to raise wholesale funding locally in sufficient amounts to fund its loan portfolio growth. In a conflict-affected territory, like West Bank and Gaza, IFC should always make conservative assumptions for financial forecasts as well as structure a transaction with sufficient grace period, appropriate covenants for financial ratios, and a contingent equity provisions for additional risks IFC assumed.

## APPENDIX E REGION UPDATES

For IFC Advisory Services projects, during the review period, IEG validated 12 projects and assigned mostly successful or higher rating to 6 projects (50 percent), lower than IFC average for such projects (64 percent) (table 3).

To be successful in conflict-affected countries, IFC found the need to have locally-based staff with a strong network and local language proficiency over the length of the project for Advisory Services projects. Without local personnel providing introduction to key government and private sector representatives and some local insights on how to maneuver the local politics and internal workings of the government machinery, success eluded an IFC public-private partnership project in Yemen. The main lesson from IFC's housing finance projects in the Region was that project design should include post-implementation assessment of training and capacity building.

### FINDINGS FROM THEMATIC, GLOBAL, AND CORPORATE EVALUATIONS

IEG's evaluation of *World Bank Group Support to Electricity Access, FY2000–2014* (2015) gives examples of analytic and advisory activities (AAA) that combine sound conceptual analysis with documentation of field-based evidence. An excellent example is from Yemen (World Bank 2011b). The paper presents a brief overview of the underlying theory and demonstrates its application with an econometric analysis using the database from a 3,000-household energy survey. The study found that household willingness to pay for electricity is closer to the price actually paid than had been assumed. Thus, electricity tariffs will either have to be enough to justify the cost new investments supported by the Bank, or there will have to be other benefits to justify a subsidy.

IEG's evaluation *The Poverty Focus of Country Programs: Lessons from World Bank Experience* (2015), includes Egypt as one of 10 country case studies. It points out that limited availability of the full data sets made it difficult to assess the quality of Egypt's poverty data, at least until the 2010 revolution, and thus difficult to design effective poverty reduction support. Compounded by the challenges in using the administrative price and the concentration of households at relatively low levels of consumption, Egypt poverty estimates were highly sensitive to the choice of poverty lines. Using estimates from the Central Agency for Public Mobilization and Statistics, some poverty diagnostics may have missed the increasing vulnerability of migrant workers in the informal sector in urban areas, even though the diagnostics correctly identified poor households in Upper Egypt. This prevented a robust signal to policymakers.

IEG's evaluation *The Big Business of Small Enterprises: Evaluation of the World Bank Group Experience with Targeted Support to Small and Medium-Size Enterprise, 2006-12* (2014) indicated the importance of targeting in the context of developing a financial institution. When an IFC client bank had three corporate goals of developing small and medium enterprise (SME) lending, mortgage lending, and regional lending, SME lending performance did not meet expectations because, without targets, the financial institution chose to do more corporate lending. Often, SME targeting in a financial institution has to be complemented by support of the SMEs. The IEG study also distilled the experience of IFC's West Bank and Gaza Olive Oil Supply Chain Development Project where performance of a group of SMEs that "lack knowledge of required skills and performance standards to operate effectively" was enhanced, by linking them to value chains involving large firms.

IEG's *Investment Climate Reforms: An Independent Evaluation of World Bank Group Support to Reforms of Business Regulations* (2014) demonstrated the value of good targeting. In Morocco, IFC's Alternative Dispute Resolution (ADR) project awareness-raising campaigns and public outreach efforts employed a targeted approach to entice women to ADR. Not only was gender integrated in awareness-raising events, but commercial mediation and its implication on women business owners was the focal point of several events, such as a national conference. Also, IFC was able to train women mediators while at the same time supporting a mediation center.

#### EVALUATION FINDINGS FROM COUNTRY PROGRAM PERFORMANCE IN THE REGION

Only two CLR's were completed during the period (both in FY14), a small number due to regional instability and timing considerations (table 7). There was one Country Program Evaluation for Tunisia, FY05-13.

The Morocco Country Partnership Framework (CPS) outcome was rated moderately satisfactory. The Bank helped achieve results in many ways. For example, an analytical note recommended reforming subsidies, and an impact evaluation of a cash transfer pilot showed reduced drop-out rates by 57 percent. The results fed into a scaling up of the program at national level, supported by a DPL. In another example, the Bank Group's increased emphasis on inclusive civil society partnerships, made a significant contribution in reducing social exclusion in terms of participation, access, transparency and ownership. IFC stepped up its investment operations during the CPF to restore investor confidence for Morocco through equity investments and with additional resource mobilization from IFC's Asset Management Company. The IFC program contributed to the CPF Focus Area: Growth, competitiveness and employment, in particular, by establishing a credit

## APPENDIX E REGION UPDATES

infrastructure more conducive to SME finance. In other areas, such health, education, and transport sectors, IFC was unable to contribute as planned through PPP Advisory Services projects.

The Djibouti outcome was rated moderately unsatisfactory. Making headway on social inclusion and governance proved challenging in an environment surrounded by instability without a Bank office in Djibouti, and constrained by limited IDA resources. Lessons included: (a) when government ownership is unclear the likelihood of success is limited; (b) the absence of an effective supervision system prevents timely identification and solution of problems during implementation; (c) when there is a mismatch between objectives and interventions the program is likely to fail in achieving its objectives; (d) weak monitoring and evaluation compounds the problems of executing a program where the interventions are weakly linked to the objectives, as was the case with governance; (e) incorporating lessons from past programs and interventions is likely to lead to more realistic outcomes; and (f) complex results frameworks with multiple and unmeasurable indicators make it difficult to monitor the program and evaluate its impact.

The Tunisia Country Program Evaluation rated overall achievement prior to 2011 unsatisfactory and rated relevance and design for the post-2011 period satisfactory (FY15). It makes the following recommendations: (a) conduct political economy analysis to better manage risk in a volatile environment; risk mitigation scenarios are needed based on an ongoing analysis of risks associated with the political economy and conflict, complemented as necessary by specific political economy analysis of reforms in critical sectors; (b) galvanize broad public support for reform; this would help to enhance the capacity of stakeholders to raise awareness and gradually build ownership of the reform agenda, thereby helping overcome resistance to change from vested interest; (c) selectively and carefully sequence first-order policy reforms (based on the political economy analysis) in designing Bank Group strategy, taking into account capacity and other constraints inherent in the transition period; and, (d) build government ownership and capacity on how to roll out the reform agenda.

## South Asia

### REGIONAL CHALLENGES AND EVALUATION FINDINGS FROM WORLD BANK GROUP OPERATIONS IN THE REGION

Real gross domestic product growth in the South Asia Region rose to an estimated 6.8 percent in 2014 from 5.0 percent in 2012 and 6.2 percent in 2013. It is expected to increase to 7 percent in 2015. This accelerating growth in South Asia contrasts with the overall deceleration of growth in developing countries. It is mostly driven by growth in Indian economy which is expected to be among the highest growth countries in 2015 (7.5 percent in India versus 7.1 percent in South Asia and 4.4 percent in developing countries). This growth is led by a cyclical recovery and supported by a gradual strengthening of demand in high-income countries. The decline in global oil prices has also benefitted the Region, driving improvements in fiscal and current accounts and facilitating the easing of monetary policy.

South Asia has experienced a long period of robust economic growth, averaging 6 percent a year over the past 20 years. This strong growth has translated into declining poverty and other improvements. However, since 1990 poverty reduction has been slower in South Asia than in other Regions and apart from Sub-Saharan Africa, South Asia remains home to the largest number of people living in extreme poverty; 34.5 percent of the extreme poor live in South Asia while only 25.7 percent of people living in developing countries, live in South Asia (PovcalNet, 2012).

Regional strategy supports three pillars: unleash the drivers of growth, enhance social inclusion, and mitigate and adapt to climate change, and two cross-cutting themes: enhance the effectiveness of governments and gender action (March 2015 Regional update; regional integration replaced by gender action partly under social inclusion). Based on favorable economic developments, the Bank is selectively scaling up its assistance from a low level in FY12–13 with a gradual transition toward supporting policy reforms and the launch of transformational projects. World Bank lending commitments amounted to \$7.9 billion in FY15 against \$10.5 billion in FY14, which is more in line with the FY10–15 average of \$8.5 billion (table 5). Compared to previous years, commitments amounts increased substantially for social, urban and rural resilience, agriculture, finance, and macroeconomics. They dropped significantly for infrastructure (energy, transport, and water) and were negligible for environment and natural resources.

The performance of Bank operations in the Region has been higher than the Bank average over the last few years and the gap has been somewhat increasing. Seventy nine percent of project exiting in FY12–14 were rated moderately satisfactory or higher compared to 70 percent Bank-wide (figure 1). South Asia regional portfolio

performance has improved from the FY13 baseline (FY10–12) of 70 percent and is now exceeding the FY17 target of 75 percent while Bank-wide portfolio performance declined from 71.2 percent in FY13 to 70 percent in FY15.

Project performance in education, social protection, transport, and water, which account for 40 percent of FY12–14 commitments, was strong compared to Bank-wide sector average (table 1) and above the FY17 corporate target of 75 percent. In addition, performance of South Asia energy projects improved from 67 percent to 75 percent in FY14 and 100 percent of agriculture projects that exited the portfolio in FY14 were rated moderately satisfactory or above. Governance and finance performance improved but remained much below the regional average and below respective GP Bank average.

Project performance drivers are not different in the Region compared to the rest of the World Bank (table 4).

Quality at entry is strongly associated with successful project outcomes. For instance, satisfactory quality at entry in Nepal Rural Water II included: (i) taking into account lessons from predecessor project and from experience elsewhere; (ii) emphasis on community decision-making in all stages; (iii) a detailed M&E framework and means to implement it; and (iv) attention to disadvantaged populations which accounted for 54 percent of project beneficiaries. India Power System Development IV, a repeater project, is another example of satisfactory quality at entry based on the deep knowledge of India power sector, the Bank team accumulated through a series of three similar projects the Bank supported since 1993 (a fifth project is now under implementation) and strong partnership developed with sector authorities and the Indian transmission utility, now one of the world's largest.

Quality at entry of unsuccessful operations was often unsatisfactory with lessons of experience elsewhere not taken into consideration (Maldives Mobile phone banking), risk assessment (political, fiduciary and governance, institutional capacity) and identification of risk mitigation measures were too weak (Maldives Mobile phone banking and Pakistan Trade and transport facilitation). Assessing political risk (government ownership and commitment) and institutional capacity risks are particularly important for first-time projects or pilot projects. Also for this type of projects, incremental approaches are highly recommended as it allows “learning by doing” as well as a simple design (Bangladesh Local Governance Development).

Good supervision is also essential and, in some examples, may have compensated for shortcomings at entry (Bangladesh Local Governance Development). Good

## APPENDIX E REGION UPDATES

supervision includes regular thorough supervision missions and technical support from relevant Bank experts for sub-project components (India National Agriculture Innovation an India Uttar Watershed). Shortcomings in supervision are related to inability to engage effectively with government counterparts, poor responsiveness to project implementation challenges, slow follow-up on issues, and lack of continuity in task team leadership (Pakistan Trade and transport facilitation).

Political risk (government ownership and commitment) is often underestimated. While it may be difficult to incorporate political risk mitigation in the project design, it is important for the project team to remain proactive in managing government commitment and adjust the project in due course.

The quality of the results framework and M&E system design, implementation and use are essential. The share of project M&E rated substantial or higher remained above the Bank average (38 percent for South Asia compared to 29 percent Bank-wide over FY12–14) but declined from 41 percent in FY11–13 (table 6). M&E shortcomings in South Asia are not different from those in the rest of the Bank. Outcome objectives and targets are not always realistic and measurable over the project lifetime. Other frequent shortcomings include: (i) missing, incomplete, or delays in setting up a project monitoring information system; delays in conducting baseline surveys; weak or inexistent feedback loops between the project monitoring information system, sector-wide M&E, and project management.

IFC success rate in the Region, by number of investment projects, was above average. For FY12–14, IEG validated 32 investment projects and assigned mostly successful or higher ratings to 20 projects (63 percent), which was above the IFC average of 58 percent (table 2). By investment commitments, the Region's success rate was also above the average success rate (78 percent versus 69 percent).

The key lesson from IFC equity investments is the importance of down-side protection, in particular for volatile markets. IFC's experience in India's manufacturing sector demonstrated the importance of detailed analysis of all derivative exposures and due consideration of worst case scenarios. For investment in an early stage technology company, due diligence has to be extensive and thorough to look at the all aspect of the business from management, products, markets, pricing, stability of customer base, marketing strategy, to the estimation of the end user adoption. When working with a willing sponsor, IFC was able to advise on gender issues and support the development of a "women employee friendly" manufacturing plant.

During the review period, 21 of 30 reviewed Advisory Services projects were rated mostly successful or higher (70 percent), which was above the IFC average of 64 percent (table 3).

Collaborative approaches with relevant partners was key to the success of Advisory Services projects. For example, in India energy efficiency public-private partnership (PPP) projects (Bhubaneswar Street Lighting and Rajasthan Public Street Lighting), extensive consultations with investors and stakeholders at an early stage of preparation identified that the project was not viable without additional revenues. Based on sound and thorough financial analysis conducted by IFC, the municipal authority was convinced to provide the needed additional funding. Consultations also helped to build a broad base of support, market the project to investors, and design clauses for the bid documents that were key in achieving a commercial success.

One operation from Multilateral Investment Guarantee Agency (MIGA) over FY09–14 has been evaluated and validated and rated satisfactory or higher.

#### FINDINGS FROM THEMATIC, GLOBAL, AND CORPORATE EVALUATIONS

IEG's *The Poverty Focus of Country Programs: Lessons from World Bank Experience (2015)* assessed the quality of data, diagnosis, focus of country program design and implementation and feedback loops between these four links in the causal chain over the past two decades. Bangladesh is a good example of how these elements worked reasonably well in the Bank's contributions to Bangladesh's poverty reduction and how it could have worked better. Bank support to the various survey rounds of Household Income Expenditure Survey (HIES; every five years) over a 20-year period created a strong database and effective partnership, which could have expanded earlier to include other key surveys (such as labor force surveys) and more capacity building at the Bangladesh Bureau of Statistics. The Bank could have devoted more attention to the challenge of poverty monitoring between the five-year HIES rounds, especially for impact monitoring of poverty programs and short-term interventions as well as targeting. Poverty assessments closely followed the HIES rounds with strong analytic and research links and consistent messages; a programmatic approach to them might have provided more timely inputs into strategy formulation. The alignment of the Country Assistance Strategies (CASs) with the Bangladesh Poverty Reduction Support Papers (PRSPs) facilitated a strong poverty focus. The recommendations of poverty diagnosis had an increasing policy impact over time as reflected for example in the increased and substantial Bank support to the social safety nets program. However, the analytical base weakened somewhat as linkages with policy-based lending and government dialogue

## APPENDIX E REGION UPDATES

weakened during FY2011–14 CAS, culminating with the 2012 cancellation of the Padma Bridge Project, which clearly addressed the issue of regional integration highlighted in 2008 poverty assessment as well as of the potential Poverty Reduction Support Credits. The World Bank succeeded in preserving a poverty focus to its program following the cancellation, but this episode suggests that the Bank's reputational risk assessment could have been more effectively managed so as not to sacrifice impact on key development outcomes and poverty reduction.

South Asia and Sub-Saharan Africa are where the largest share of people do not have access to electricity or inadequate or unreliable service, affecting negatively progress in human welfare and quality of life, hampering economic productivity and growth and adversely affecting business performance and productivity. IEG's *World Bank Group Support to Electricity Access, FY2000–2014* (2015) identified a number of good practice national access scale-up experiences, some with significant World Bank Group support. Bangladesh off-grid experience is one of these, although most of its success resulted from the stalled grid expansion when ideally, grid and off-grid rollout should be undertaken simultaneously in a coordinated manner nationwide. In any case, the Bangladesh experience shows that off-grid solutions – mainly solar home systems and mini/micro-grids – are a fast way to provide energy services to rural and remote areas. Unfortunately, Bank Group support to off-grid electrification in the past 15 years has only been a small part of its electricity portfolio (1.5 percent of its FY2000–14 portfolio).

The sustained benefits of early childhood interventions and contribution to reduce poverty and breaking the intergenerational transmission of poverty are well established. IEG's *World Bank Support to Early Childhood Development* (2014) highlights the misalignment between the Bank's engagement and country needs in this area. In the specific area of nutrition, South Asia and Sub-Saharan Africa, which have the highest stunting rates, attention has been below what would be needed. Bangladesh and Nepal are notable exceptions, in those two countries, maternal and child care, and primary education including preschool have been long-standing priorities of the government supported by the World Bank and development partners through successful successive sector-wide programs. Moreover, interventions were targeting to disadvantaged populations, mostly in rural areas. Still the focus on children is addressed on a sector-by-sector basis with a limited impact on critical multisectoral issues such as nutrition. In Bangladesh, there has been little improvement in the nutritional status over 2004–2011 and IEG assesses that the World Bank has made little or no contribution to reducing child malnutrition (PPAR Bangladesh Health projects, IEG 2014). More recently, the World Bank Social Protection and Labor team has carried out pilots and evaluations

of cash transfer systems that improved the nutritional status of children in Bangladesh (see coverage in current CAS).

In Nepal, the World Bank has been actively involved in country dialogue on nutrition and the Bank's analytical work focuses heavily on nutrition. Following the Bank's recommendation to attacking malnutrition with a multisector approach, the government has approved a multisector nutrition plan and set up appropriate coordinating institutions, but it is too early to assess results.

*IEG's World Bank Group Assistance to Low-Income Fragile and Conflict-Affected States (2013)* highlights the critical role of effective coordination and synergies among Bank Group institutions in the success of Bank Group support to microfinance in Afghanistan. IFC supported the First Microfinance Bank of Afghanistan, which has been highly successful in extending microloans. MIGA also supported another microfinance institution (MFI) in Afghanistan. Both MFIs started off as implementing partners of Microfinance Investment Support Facility for Afghanistan. The Bank complemented support to MFIs with knowledge and advisory projects.

*IEG's Investment Climate Reforms: An Independent Evaluation of World Bank Group Support to Reforms of Business Regulations (2014)* notes that IFC's major programmatic approach through the Bangladesh Investment Climate Fund was key in overcoming country political risk. A programmatic approach allowed the Bangladesh Investment Climate Facility (BICF) to re-engage with the line ministries at all levels to push a program forward after a change in government. In addition, the BICF promoted a Good Practice Gender Framework for Special Economic Zones (SEZ), which will be rolled out in all future IFC-sponsored SEZ projects and a global study on gender in SEZs (World Bank and IFC 2011), and implemented a pilot project in Bangladesh focusing on initiatives to increase opportunities for leadership, upward mobility, and financial inclusion for female workers.

*IEG's The Big Business of Small Enterprises – Evaluation of the World Bank Group Experience with Targeted Support to Small and Medium-Size Businesses (2006–2012) (2014)* shows that IFC's SME Toolkit was an effective instrument to build the capacity of banks to assess SME credit requests and manage risks related to new SME lending. For example, a project in Sri Lanka supported a commercial bank to: (i) analyze profiles of potential SME clients and develop a new SME loan business; (ii) build up the its capacity in due diligence and risk management of the new SME lending; (iii) identify gaps in organization structure to deal with SMEs; (iv) develop a risk rating system. The project also advised on loan pricing and assisted in developing key performance indicators of new SME operation.

EVALUATION FINDINGS FROM COUNTRY PROGRAM PERFORMANCE IN THE REGION

Over the past 3 years, IEG has reviewed CLRs for India and Bhutan, for which country program outcomes were rated moderately satisfactory, and Pakistan, which was rated moderately unsatisfactory (table 7). IEG also published a full Country Program Evaluation for Afghanistan that rated program outcome moderately satisfactory.

Country programs were mostly successful on growth drivers and social inclusion. The outcomes of pillars related to growth drivers were rated moderately satisfactory in all countries except for Pakistan (rated moderately unsatisfactory). Outcome of pillars addressing human development and social inclusion were all rated moderately satisfactory. Only Afghanistan and Pakistan programs had a specific pillar on government effectiveness and outcomes were rated moderately satisfactory and unsatisfactory respectively.

Although a main pillar under the regional strategy, climate change mitigation, environment, sustainable development, and disaster management were not prominent in any of the reviewed country programs except India the outcome of which was rated moderately unsatisfactory. The Bhutan program included a subcomponent on disaster management under the integrated sustainable rural-urban development pillar and all objectives were achieved. One objective in the Pakistan country program was related to sustainable development under Pillar III on improving infrastructure to support growth, its outcome was rated moderately unsatisfactory.

Country programs were mostly successful on growth drivers. In India, the Bank Group's work on inclusive growth delivered on its main commitments and contributed to the outstanding national outcomes through catalytic effects in some areas, such as community development in rural areas. Good progress was achieved in the power sector as reflected in improved access and strengthened institutions, as well as in the education and rural water and sanitation sectors, where the World Bank maintained a long-term engagement. The Bank Group's work on improving agricultural productivity contributed to the good national outcomes, although engagement with the low-income states in agriculture was limited while work in agribusiness was just starting. Progress was also made in the transport sector. The Bank Group scaled up its microfinance program and the transfer of resources to India during the crisis, but did not meet the policy objectives in the financial sector. The Bank Group's work on skills development produced localized results, but had little impact on addressing skill shortages more broadly.

In Bhutan, all objectives were achieved or mostly achieved, including improving regulatory environment, the formulation of new policies in licensing, PPP, financial inclusion and increasing access to credit but Bhutan ranking in Doing Business declined, new policies were not adopted and the increase in lending to banks mostly financed real estate and consumption rather than productive investment. While the IFC program correctly identified key challenges, such as business licensing, attracting private investments, and availability of credit to support the local private sector, when designing interventions, such as the PPPs and facilitating access to credit, IFC appears to have underestimated the constraints imposed by Bhutan macroeconomic fragility on economic growth and prevailing incentives for commercial lending, hence the bleak medium-term private sector development.

The World Bank Group was less successful in Pakistan. Except in urban development (urban and municipal infrastructure and services), most outcome objectives were not achieved or partially achieved, including those related to increasing power provision and efficiency and reliability of energy supply and the strengthening of irrigation infrastructure and agricultural competitiveness. In Afghanistan, impressive results have been achieved in the development of microfinance and telecommunications and Bank assistance has been critical in developing the mining sector as a potential engine of growth. However, progress in agriculture and private sector development has been limited while power supply remains a major constraint.

The outcome of pillars addressing human development and social inclusion were rated moderately satisfactory in all four countries. Strong results have been achieved in social safety nets (India, Pakistan, and Afghanistan), microfinance (India), improving rural communities' access to social and productive infrastructure and livelihoods (Pakistan, Bhutan, Afghanistan) but sustainability and community-level governance remain a challenge and objectives in rural communities' access to water and sanitation were not achieved in Bhutan. Results were mixed in health and nutrition in India and weak in Pakistan but satisfactory in Afghanistan. Weak support and a fragmented approach to child malnutrition in the India program was arguably the weakest element of the World Bank strategy given the severity of the problem. In the Bhutan program, national awareness of issues and policy options in nutrition was raised through analytic work; the government's Eleventh Five-Year Plan highlights issues in nutrition very prominently; the attention from government and media has been high in response to the findings of the Bank's analytic work on nutrition indicating the gravity of issues related to stunting and malnutrition, and the ongoing programs that can be used to address them, with suitable modifications. Implementation of follow-up policy actions is reported to have since begun.

## APPENDIX E REGION UPDATES

Progress in government effectiveness has been limited in India and Pakistan but more encouraging in Bhutan and Afghanistan. The India program delivered little turnaround in governance both at central and local levels where there is a need for sustained long-term engagement. In Pakistan, all the related objective were either partially or not achieved, including in strengthening macroeconomic management, tax policy and administration, public expenditure, financial and public procurement management, and capacity and accountability in public sector management. World Bank support was more successful in Bhutan and Afghanistan. In Bhutan, significant progress was made in modernizing public budgeting and monitoring while service standards were established for public services. Yet much remains to be done to address equity and efficiency issues in education, health, and nutrition as identified in World Bank analytical work. In Afghanistan, substantial progress was made in public financial management but progress was much more limited in civil service.

World Bank engagement and performance on issues related to climate change mitigation, environment, sustainable development, and disaster management in South Asia seems still sparse and uneven. In India, supported by ample AAA, a substantive program emerged to address environmental and climate change issues, although concrete results were still scarce. In Pakistan, the objectives of strengthening sustainability for better health outcomes and improved competitiveness were supported by substantial analytical work and environmental work under important projects. This support has likely contributed to raising awareness and translated into the National Climate Change Policy launched in early 2013, but implementation has yet to start. All the objectives of Bhutan's program related to disaster risk management were achieved, including passing a national Disaster Management Act, strengthening disaster management capacity and preparing a plan for schools and hospitals.

All four country programs highlight the importance of clear, realistic results frameworks and sound M&E systems proactively managed and used. India's complex and dynamic development environment calls for cultivating a collaborative and receptive partnership with government and executing agencies. It also highlights the collaborative challenges such as multisectoral approaches in sectors such as urban development, nutrition, and water resource management and World Bank-IFC collaboration. While World Bank-IFC collaboration did improve markedly, it still fell well short of potential and of the expectations of key stakeholders, not least the Indian authorities. In contrast, when both organizations are aligned to common strategic objectives (such as capacity building in low-income states, increased investment in climate change adaptation) and collaboration follows each institution's relative operational strengths, achievements exceed what each agency could achieve independently. PPPs are one area in which experience

demonstrated clearly differing institutional strengths with IFC's transaction and business climate experience complementing the policy orientation of the World Bank.

Pakistan experience demonstrates the importance of donor coordination on long-term issues such as energy development. It also highlights the pay-off that persistent engagement in key activities, even during difficult times, can have results. It underlines that development results would likely be improved if the World Bank probed more systematically on political economy considerations to select support programs with fair chance of being implemented. For countries in transition, such as Bhutan, experience shows the importance of budget support for policy dialogue and reforms. Among the lessons from the Afghanistan, some are relevant beyond fragile and conflict situations: (i) gender mainstreaming is feasible even in fragile and conflict contexts with cultural constraints if addressed systematically and can deliver substantial results in terms of service delivery and increase economic and social opportunities for women when addressing gender issues is an integral part of the country program; (ii) World Bank Group analytical work plays a critical role in filling knowledge gaps in key sectors and the underlying drivers of political economy.

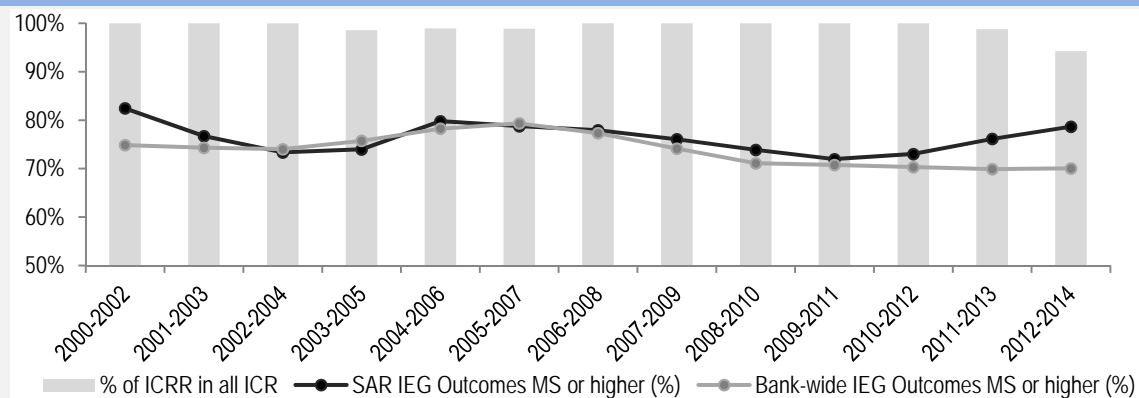

World Bank performance was satisfactory or good for the India, Bhutan, and Afghanistan programs and fair for Pakistan. The World Bank Group program in India showed considerable flexibility and high responsiveness to government increased demand for funding and scale-up of engagement in priority areas. Portfolio performance was good and the knowledge agenda was generally supportive of the program. Collaboration between the World Bank and IFC increased in several areas and cooperation with other development partners supported program implementation. However, a number of design and implementation issues need to be addressed, including: (i) a clearer differentiation between areas of mature engagement and areas of advocacy or exploration where results are uncertain; (ii) the results framework suffered from various deficiencies; (iii) the support for advancing the agenda to reduce child malnutrition was too weak; and (iv) fiduciary concerns remained an issue throughout the Country Partnership Framework period.

Limitations in Bhutan relate to : (i) delays due to weak technical and implementation capacity not reflected enough in the design, which was ambitious for private sector and urban development; (ii) constraints imposed by Bhutan macroeconomic fragility on economic growth and by prevailing incentives for commercial bank lending on private sector development in the medium term were not fully appreciated and reflected in the program design; and (iii) the results framework was weak in the

APPENDIX E  
REGION UPDATES

choice of indicators and the weight given to process and outputs. In Afghanistan program, World Bank Group performance was good; internal drivers of success included the quality of AAA (in some sectors), customization of design to the country context, and staff capacity. World Bank performance was rated fair in Pakistan because both the results framework and M&E were weak, the program contribution to the CPF objectives was uneven with weaknesses in several areas, and actual collaboration with IFC was also weak.

# Appendix F. Global Practice Cluster Updates

## Equitable Growth, Finance, and Institutions Global Practice Cluster

The Equitable Growth, Finance, and Institutions (EFI) Cluster consists of the following five Global Practices:

- **Finance and Markets:** seeks to develop resilient, efficient, and transparent financial systems to help mobilize capital needed for investments in country development priorities
- **Governance:** develops innovative, integrated solutions to pernicious institutional problems using a problem-driven, diagnostic approach that combines knowledge of reform successes and failures with a keen understanding of institutional challenges and opportunities in developing countries
- **Macroeconomics and Fiscal Management:** provides integrative development strategies, policy-based lending, macro data, global perspectives, real-time policy analysis, country risk assessments, and innovative projection tools
- **Poverty and Equity:** seeks to deliver advice and integrated knowledge to identify key policies and multisectoral solutions that effectively reduce poverty and benefit the less well-off, and to help better understand the relationship between growth, poverty, and inequality
- **Trade and Competitiveness:** helps countries develop more dynamic and integrated economies by boosting trade, enhancing the investment climate, improving competitiveness in sectors, and fostering innovation and entrepreneurship.

EFI is the World Bank's second largest cluster, with commitments of \$11 billion in FY15 amounting to 26 percent of the total Bank lending<sup>1</sup> (table 3). In comparison, total commitments for the largest cluster – Sustainable Development were \$22 billion, (52 percent of the total Bank lending). The commitments for the Human Development cluster were \$9.3 billion (22 percent of the total Bank lending).

### PERFORMANCE TRENDS

During FY05–14 the percentage of the EFI cluster's investment projects that were rated moderately satisfactory or higher (MS+) was consistently lower than those of the Human Development and Sustainable Development clusters (figure 1). The spread widened for FY12–14: 71 percent of Human Development and Sustainable Development projects were rated MS+ compared with 58 percent for EFI projects (as recent as FY11 and FY12).

## APPENDIX F GLOBAL PRACTICE CLUSTER UPDATES

A specific look at DPOs, however, shows a different trend from FY05–13 (figure 2). DPOs in the EFI cluster consistently had a high percentage of DPOs rated MS+ compared with the Human Development and Sustainable Development clusters. The exception is FY12–14, when 89 percent of Human Development and Sustainable Development DPOs were rated MS+ compared with 74 percent in the EFI cluster.

Regarding financing source, IBRD-financed projects in the EFI cluster had consistently better ratings than IDA projects during FY05–14, measured as the percentage (on a three-year moving average) of all closed projects that were rated MS+ (figure 3). There was a significant and consistent spread of as much as 20 percent between IBRD and IDA project ratings from FY10–14.

During FY12–14, 71 percent of the investment projects in the Finance and Markets Global Practice were rated MS+ or higher, compared to 50 percent for Governance Global Practice. The remaining Global Practices had less than 10 projects each (table 1).

Disaggregated by Regions from FY12–14, 82 percent of the investment projects in Europe and Central Asia Region were rated MS+. All other Bank Regions ranged from 50 percent to 67 percent – Latin America and Caribbean and the Middle East and North Africa Region (67 percent each); Africa and South Asia Regions (51 percent and 50 percent, respectively). East Asia and Pacific Region was the lowest with 42 percent rated moderately satisfactory or higher (table 2).

Regarding monitoring and evaluation (M&E) quality for EFI projects that closed FY11–14, only the Macroeconomic and Fiscal Management Global Practice had 40 percent of projects rated as substantial (figure 4). The other Global Practices ranged from 18 percent to 29 percent, with Trade and Competitiveness rating the lowest in achieving M&E quality ratings of substantial or higher.

### MAIN EVALUATION FINDINGS AND LESSONS

This section summarizes key findings and lessons from IEG’s major evaluations, learning products, and Project Performance Assessment Reports (PPARs) completed during FY12–15 and relevant to the EFI cluster.<sup>2</sup>

#### *Major Evaluations and Learning Products*

IEG’s **Poverty Evaluation** (IEG 2015g) used country case studies, surveys, focus group meetings, systematic reviews of Bank products, and other instruments, to examine the consistency of poverty focus in each of four links in a causal chain: data, diagnostics, strategy formulation, and strategy implementation through lending and nonlending instruments. The study reviewed the adequacy of the information base and usefulness

of the analytical underpinnings that support country strategy formulation and implementation. It also evaluated the consistency of the poverty focus throughout the evaluation chain and the strength and weakness of feedback loops. The evaluation found that the Bank’s work on data and diagnostics was generally robust, but with significant gaps in coverage and timeliness. Areas that require attention include improving country coverage and data capacity, reflecting the findings of the diagnostics in country strategy formulation, enhancing the consistency of the poverty focus in strategy implementation, and strengthening monitoring and feedback loops. Three main findings emerge:

- **Creating knowledge:** The World Bank provides an important public good in supporting and reporting global poverty data, and producing high-quality poverty diagnostics. The Bank can better perform this role by investing more in sustainable data collection and by adopting data reporting standards as a part of its mission. On diagnostics, it should strengthen analysis of institutional issues and sociopolitical constraints, and make policy recommendations more actionable.
- **Understanding context:** The Bank operates in a complex environment, and the choice of portfolio is conditioned by the strategic focus of a government client as well as the Bank’s comparative advantage. The government commitment to poverty reduction is a key factor in the fidelity between implementation and the formulated country strategy. When a country is not fully committed to poverty reduction, the Bank often faces a tough choice between disengaging from significant lending or engagement in areas that may be only tangentially related to poverty reduction. High-quality and timely diagnostics, policy dialogue, and technical assistance should help identify entry points and lay the groundwork for greater impact.
- **Leveraging Resources:** Given the small size of Bank resources relative to the economies it seeks to influence, the effectiveness of Bank interventions in helping clients reduce poverty will increasingly depend on how it uses instruments as pilots and as catalysts to leverage resources from development partners and other stakeholders. Strengthening the complementarity among diagnostic work, technical assistance, and lending instruments, and among policy and investment lending instruments, can help to scale up efforts and achieve more sustainable, long-term impact.

IEG’s major evaluation of the **World Bank Group’s support for innovation and entrepreneurship** (IEG 2013g) found that although investment in these areas has been substantial (\$18.7 billion) over the past decade, its effectiveness can be enhanced through broad, systemic efforts on the following set of complementary actions. At the corporate level, the Bank Group has to articulate a clear vision of how innovation can be

transformed into workable solutions to address major development problems. Urgent action is required to enhance coordination, consultation, or linkages on innovation and entrepreneurship initiatives across the Global Practices, as well as across the Bank Group institutions. Practical solutions are needed for people who earn less than \$2 a day, which are not restricted to low-income countries since middle-income countries also have large population segments living in poverty. Sustained efforts are required to experiment with different mechanisms and implementation arrangements, complemented by monitoring and evaluation systems to facilitate the scale-up of promising interventions and share knowledge across the Bank.

Another major IEG evaluation analyzed **IFC's Global Trade Finance Program** (GTFP; IEG 2013c). The evaluation found that the GTFP significantly improved IFC's engagement in trade finance by introducing an open, global network of banks and a quick and flexible response platform to support the supply of trade finance. The GTFP has high additionality among high-risk countries and banks, where the supply of trade finance and availability of alternate risk mitigation instruments are lower. IEG made the following recommendations for IFC:

- Continue to strengthen the GTFP's focus in areas where additionality is high, and increase the share of the program in high-risk markets and where the supply of trade finance and alternate risk mitigation instruments are less available
- Adopt additional methods of reporting volume that can reflect the distinct nature of trade finance guarantees
- Refine the means by which GTFP profitability is monitored and reported
- Review the costs and benefits of the current M&E framework
- Ensure that a transparent process is in place to govern cases of covenant breach
- Enhance the program's ability to meet the demand for coverage of longer-term trade finance tenors.

IEG's major evaluation on investment climate reforms, **An Independent Evaluation of World Bank Group Support to Reforms of Business Regulations** (IEG 2014a), showed that the World Bank Group has been providing extensive support to investment climate reforms, including 819 projects with investment climate interventions in 119 countries for a total estimated value of \$3.7 billion during FY07-13 period. IEG found that the World Bank Group supported a comprehensive menu of investment climate reforms in the right countries and generally in the right areas of the regulatory environment. The World Bank Group relied on a variety of investment climate diagnostic tools, but their coverage is incomplete. Intervention and country case analysis shows that within the limits of the available measures of investment climate indicators, the World Bank Group was successful in improving investment climate in client countries, as measured by number of laws enacted, streamlining of processes and time, or simple cost savings

for private firms. However, the impact on investment, jobs, business formation, and growth is not straightforward, and the social value of regulatory reforms; that is, their implications for inclusion and shared prosperity, as reflected in effects on a range of stakeholders, was not properly included in the design of reforms and assessment of their impact.

Although regulatory reforms need to be designed and implemented with both economic and social costs and benefits in mind (in practice), World Bank Group support focuses predominantly on reducing costs to businesses. Simplicity of design and good risk assessment play a special role in achieving satisfactory outcomes. Political instability and lack of political commitment remain major problems, limiting the effectiveness of investment climate reforms. In supporting investment climate reforms, the World Bank and IFC use two distinct but complementary business models. IEG recommended the following to the World Bank Group:

- Expand the coverage of current diagnostic tools and integrate them to produce comparable indicators so they can capture the areas of the business environment not yet covered by existing tools
- Develop a differentiated approach to identify the social effects of regulatory reforms on all groups expected to be affected by them beyond the business community
- Ensure that the World Bank Group takes advantage of the complementarity and strengths of the World Bank and IFC business models when designing the new Trade and Competitiveness Global Practice.

In its evaluation **World Bank Group Support to Public-Private Partnerships: Lessons from Experience in Client Countries, FY02-12** (IEG 2014h) IEG found that designing, structuring, and implementing PPPs remains a challenging and complex effort. The study generated several important findings:

- The World Bank's upstream policy reform and institution building reaches the right countries, but the sector reform work failed in almost half of the cases because of the complexity and political implications of the reform processes. Advice on how to manage fiscal implications from PPPs is rarely given.
- The World Bank Group significantly contributed to capacity building for PPPs, but a lack of local skills and resources for the preparation of a PPP pipeline and bankable PPP projects poses a serious limitation across most World Bank-supported countries. IFC Advisory Services achieved important impacts in advising on PPP structuring, although only about half of the projects result in a contract award, mostly because of volatile government commitment. IFC also added value when investing in PPPs during due diligence and implementation,

but a higher share of its PPP portfolio could be in countries and markets with less developed PPP frameworks. MIGA increased investor confidence and effectively implemented PPPs in countries about to develop their PPP frameworks.

- Public-private partnerships supported by the World Bank Group are largely successful in achieving their development outcomes, but data are scarce on the effects on the poor. The World Bank Group institutions deploy their respective comparative advantages well, but their approach should be more strategic and better tailored to countries.

To further improve the World Bank Group's PPP ambitions as stated in its latest strategy, the IEG evaluation recommends the following actions:

- Translate the World Bank Group's strategic PPP intentions into an operational framework
- Better assist governments in making strategic decisions regarding the level and type of private sector participation, and in assessing fiscal implications
- Identify avenues to increase IFC investments in PPPs in countries and markets that do not have a well-developed enabling environment
- Ensure broad stakeholder consultation and government commitment in IFC's advisory work
- Provide authoritative guidance to staff on how to handle unsolicited PPP proposals
- Define principles for monitoring PPPs in the long run to capture all vital performance aspects, including user aspects where relevant.

IEG's evaluation on small and medium enterprises, **The Big Business of Small Enterprises: An Evaluation of the World Bank Group Experience with Targeted Support to Small and Medium-Size Enterprises, 2006–2012** (IEG 2014f), highlights the importance of causal chains. Based on a portfolio averaging about \$3 billion a year in commitments, expenditures, and gross exposure during 2006–12, IEG found that a critical challenge is to root the many small and medium enterprise (SME) activities in a clear understanding of the characteristics and dynamics of SMEs, their role in the broader economy, and their actual and potential contribution to jobs, growth, and shared prosperity. A closely related challenge is to formulate clear strategies that connect interventions to intended outcomes, through solid measurement systems that provide evidence of results and allow learning. As the World Bank Group continues to support SMEs, the IEG evaluation concludes that the World Bank Group could be more effective by doing several things:

- Clarify its approach to targeted SME support by harmonizing SME approaches, and by making clear objectives and analytic justification for targeted SME support, how it relates to systemic reform, where it is appropriate, what main forms it will take, and how it will be monitored and evaluated
- Enhance relevance and additionality by shifting benefits from better-served firms and markets to frontier states (those with underdeveloped financial systems, especially low-income and fragile and conflict-affected countries), frontier regions, and underserved segments
- Institute a tailored research agenda
- Strengthen guidance and quality control so that World Bank Group project documents targeting SMEs define and justify the specification of the beneficiary group, provide specific targeting mechanisms, and include impact indicators in its results and M&E evaluation frameworks
- Reform MIGA's Small Investment Program, considering either a merger with its regular program or a fundamental redesign to improve performance.

IEG also conducted an internal review of **The World Bank Group's Experience with Lines of Credit to Support SMEs, FY06-12** (IEG 2014f). The review covers a portfolio of World Bank and IFC lines of credits on-lent to SMEs and focuses on 10 World Bank lines of credit, 29 IFC lines of credit, and the findings of two field visits conducted for IEG's evaluation of targeted support to SMEs. Findings of the review include:

- World Bank Group lines of credit were concentrated in upper middle-income countries, influenced by the global financial crisis during part of the evaluation period
- World Bank and IFC lines of credit often included parallel technical assistance, and the projects generally achieved superior development effectiveness rating and additionality
- The division of work between the World Bank and IFC was not uniformly consistent with prevailing strategy, policy, and guidance notes
- M&E was weak, and the impact of the loans at the financial intermediary and SME level was mostly unrecorded.

IEG's learning product on **Macro Framework in DPOs** (IEG 2015h) found that, overall, the macro-fiscal frameworks presented in DPO desk reviews of a number of case studies are broadly adequate. Basic macro frameworks in most cases are consistent, credible, and sustainable as presented in the program document as well as in related evidence, for example, International Monetary Fund (IMF) reports detailed debt sustainability analysis. Some weaknesses in the quality of macro frameworks are identified in a few operations: (i) ambitiousness of macro-fiscal frameworks in some stand-alone operations and links between objectives and fiscal measures; (ii) credibility

of the framework considering the track record, political economy factors, treatment of risks, or institutional fiscal rules; and (iii) robustness of the debt sustainability analysis. In cases with no IMF program or substantial collaboration with the IMF, and where a track record is lacking, there appeared to be more weaknesses in some elements of the macro-fiscal frameworks. Greater attention is needed to ensuring the quality of macro-fiscal frameworks in the absence of IMF programs and in the presence of weak track records. The length of the time horizon of the operation (stand-alone or programmatic) affects the capacity to link substantive prior actions to significant, longer-term fiscal and macroeconomic stability results. Stand-alone operations showed specific weaknesses in the completeness and overall quality of macro-fiscal frameworks.

IEG's learning product on **Results Framework in DPOs** (Mkrtchyan, Sundberg, York, and Heider 2015) found that the presentation of the results frameworks has changed substantially in recent years with mixed results. The review notes that for the Bank's streamlined and simplified results framework model to be effective, it is critical to ensure (i) clarity of presentation of objectives and outcomes, (ii) high quality of prior actions, and (iii) comprehensive reporting of results and their attribution to the Bank's inputs at completion. Some findings and recommendations are:

- Some DPOs suffer from lack of clear statements of objectives and outcomes. This shortcoming is present in some newly approved DPOs that follow the modified template of Operations Policy and Country Services (OPCS). Their results frameworks lack explicitly stated outcomes, while result indicators in many cases fall short of meaningfully measuring a the outcomes of a DPO.
- The quality of prior actions is critical for the robustness of the results frameworks of DPOs. The review highlights recent improvements in prior actions and suggests further steps to improve their quality: Avoid actions that do not support significant policy changes such as draft regulations at early stages of preparation (before approval by governments), agency-level actions with little or no tangible implication for overall policy, statements of intentions, repeated prior actions on recurrent government functions that lack additionality, and "pilot" actions without a clearly defined strategy for scaling up. Avoid policy actions unrelated to Bank engagement with the client country, which is contrary to the Bank's approach to budget support and undermines the additionality of DPOs. The report suggests formulating guidance and standards on prior actions to improve the results orientation of DPOs.
- Excessive use of flexibility in a programmatic series can compromise a DPO's focus on results. Dropping essential triggers or accepting partially met triggers that do not capture the true essence of intended reforms may substantially undermine the quality of results frameworks. Although maintaining flexibility in DPOs is important, in many cases a better balance between flexibility and rigor

would improve a DPO's focus on results. The review also notes that recent changes in the presentation of medium-term reform programs in a programmatic series have improved the clarity of results frameworks.

- The Implementation and Completion Results Report (ICRs) of DPOs need to focus more on the quality of prior actions and provide a more comprehensive account of policy changes triggered by them. To enhance the quality of reporting on results, ICRs should reconstruct and document the implicit results chain leading from prior actions to program results. The review finds that the extension of time allocated to ICR preparation from 6 months to 12 months may enhance the quality of reporting and a DPO's evaluability. It also effectively expands a DPO's time horizon. To ensure sustainability of reform, the long-term monitoring of reform areas supported by DPOs can be integrated into the monitoring systems of both Country Assistance Strategies and Country Partnership Strategies.

#### PROJECT PERFORMANCE ASSESSMENT REPORT

IEG prepared a cluster PPAR covering three series for **Vietnam: Poverty Reduction Support Credits, Public Investment Reforms, and Support to P-135 Program for Community Development**. Eight key lessons were identified:

- Dialogue between the government and the Bank on macroeconomic and fiscal issues assumes greater importance in the absence of an IMF program, especially during periods of macroeconomic risk. In Vietnam, this warrants a rethinking of how macroeconomic stability can best be supported through DPOs. The approach during the past decade has not been effective.
- Fragmentation of macroeconomic dialogue among multiple, parallel DPOs tends to weaken both dialogue and operational content.
- Responding to macroeconomic crises at the same time as promoting long-standing institutional reforms in a single operation or series may reduce effectiveness, especially when risks that reforms may not be implemented are high and macro-stabilization issues are not specifically addressed by the DPOs.
- Excessive flexibility regarding the policy content of a programmatic series weakens the program. Although flexibility is an important feature of Bank policy lending, there is room for striking a better balance between flexibility and rigor. Inclusion of partially met triggers as prior actions should be considered with particular caution.
- Greater willingness on the part of the Bank and other external partners to withdraw their support for weakly implemented reform programs and unproductive policy dialogue can strengthen the content and outcome of future operations. The delays in the second operations of P-135 and PIR, and Poverty

Reduction Support Credits (PRSC) 10 appear to have reflected concerns with program quality, which, however, were only adequately resolved in P135. Arguments for budget predictability under the Paris Declaration are less relevant in Vietnam due to relatively small share of budget support in public expenditures.

- A strong knowledge base is of critical importance for upstream design of reforms and parallel technical assistance to support their implementation. Selectivity helps to promptly adapt knowledge products and technical assistance to the most pressing needs.
- The design and implementation of M&E for DPOs remain a challenge, and the adequacy of the M&E framework needs to be reconsidered each time a new operation within a series is launched. Logical links need to be thought through carefully and institutional responsibilities clearly delineated. Impact evaluations, whenever feasible, should be an integral part of M&E.
- Use of budget support instruments for financing programs such as P135 (community development) may entail considerable risks. The state of decentralization and capacities and capabilities of subnational governments need to be taken into account in the design and implementation of targeted poverty programs.

The main lessons of from IEG's PPAR: **Uganda Poverty Reduction Support Credits (PRSCs)** are as follows:

- Lack of clear, concrete objectives impedes both implementation and evaluation of DPOs. Framing objectives in relation to broad support of government policies (as in PRSC5–7) is best avoided.
- Focus and selectivity in policy areas is critical to DPO implementation and outcomes. The Bank, the donors, and the government have jointly adopted an overambitious and extensive policy agenda under the PRSC5–7, which diluted focus and undermined effectiveness in implementation.
- Adequately considering political economy factors in the design of major reforms is an essential requisite of the design of a successful DPO series. For example, the failure to increase revenue mobilization over a long time was directly related to the political economy of political patronage and large, entrenched tax exemptions and culture of noncompliance. Another example is the relatively strong upstream governance institutions but weak enforcement, including for offenses by government officials. Lack of policy focus on these areas undermined the quality of PRSC design and their implementation and outcomes.
- Pressures to extend budget support within the broader donor support framework without hard conditionality to raise domestic revenues can undermine incentives for domestic revenue mobilization. This, in turn, can

undercut macroeconomic adjustment needed for sustainable fiscal policy as well as the adequacy of funding for basic services.

- Implementation and evaluation are also facilitated when objectives are tightly linked to prior actions and there is a measurable and relevant results framework, with unambiguous outcome indicators and targets incorporating an explicit and convincing theory of change. DPOs strongly benefit from active incorporation of lessons from the past operations and from knowledge products (such as Country Economic Memoranda and Public Expenditure Reviews).

IEG prepared a PPAR for **Tanzania: Eight Poverty Reduction Support Credits (PRSCs)**, which were implemented as two program series between 2003 and 2011. IEG rated the outcome of the first series (PRSCs 1–3) as moderately satisfactory and the outcome of the second series (PRSC 4–8) as moderately unsatisfactory. The following lessons can be drawn from this assessment:

- Direct and sustained focus and clarity of vision over the entire course of implementation of PRSC is required to facilitate lasting reforms, particularly with regard to public sector governance.
- PRSCs can make little progress without a foundation of trust between the World Bank and the government, and among development partners at the institutional and individual levels.
- PRSC programs risk becoming irrelevant if the design, scale, and scope are not adjusted as conditions change.
- The lack of well-defined and realistic objectives and a fully developed results framework adjusts to changing circumstances difficult.
- Regular reporting on key outcome indicators is essential so that data can drive adjustments to the PRSC program.
- Transitioning to the use of PRSCs as the primary instrument for resource transfer is only likely to be successful when strong central ministries can fully pursue a sector-inclusive dialogue representing the perspectives of key players throughout government.
- Elevating to the national dialogue sector-specific structural reforms that stalled at the sector level does not guarantee their implementation.

IEG's PPAR for the **Tanzania: Public Sector Reform Project** found that an excessive focus on form rather than function in public service reform is counterproductive. Political windows of opportunity may span years but rarely decades, and reform programs that aim at improving service delivery need to show some short-term results to citizens to build support in public opinion. Capacity building cannot be seen as an effort that can show results in improved services only in the medium term. The consequences of failing to address policy reversals early can be serious, and the risks of

unfocused public service reform projects in low capacity environments are high, even when political commitment is strong.

IEG's PPAR for the **Rwanda: Decentralization and Community Development Project** yielded important lessons relevant to the EFI cluster. First, in a post-conflict environment with a history of highly centralized structures and dominant central government, decentralization can be fostered by well-designed participatory processes to promote demand-side governance and empower communities, along with intensive institutional and capacity building at central and local levels. In Rwanda, the project provided the building blocks for fostering community participation and local accountability and enhanced social cohesion through financing of sub-projects identified by communities through a participatory planning process that feed into the Annual Action Plans for the districts. Second, decentralization and capacity building is a long-term process and needs sustained government and Bank engagement. Sustained government commitment to build local capacity and institutions for planning, financing and revenue generation to improve local service delivery is fundamental to advancing decentralization. The project facilitated institutional capacity building for central and local government structures including providing training and technical assistance for priority setting, project planning, financial management, M&E, and local development planning and budgeting.

The three key lessons from IEG's PPAR on the **Jamaica: Fiscal and Debt Sustainability DPL** are as follows:

- It is essential for the Bank to work in close collaboration with the IMF and other development partners in DPL operations to ensure complementarities and increase the likelihood of success of the overall program.
- A single DPL can be a useful entry point to address an emergency, and to engage with a country where the Bank had no ongoing macroeconomic policy dialogue for an extended period. Notably, a country such as Jamaica that undergoes a systemic crisis needs a medium-term programmatic approach.
- The Bank is often called upon to make difficult choices in its policy-based lending which can involve high-risk and high-reward strategic issues. In this case, it was clear from the beginning that the program would be subject to high macroeconomic risks and the success was not guaranteed. The Bank proceeded to support government's reform program that was conceptually sound but the risk of failures was high due to the size of the problem facing the country. Under such conditions, the Bank might alternatively focus its early efforts more on institutional strengthening such as through advisory services to build capacity and to participate with significant funding in a broader reform program

supported by IMF and other international financial institutions. The subsequent program was part of such a broader package.

From IEG's PPAR on the **St. Lucia Economic and Social Development Credit**, the key lessons identified were:

- Policy reversals can cause serious damage to otherwise significant project outcomes, and are difficult to counter. District proliferation or reduction in un-earmarked funding, or local governments' rights to raise revenues, need to be monitored closely as these could be early signals of policy reversal.
- Monitoring should be focused on outcome indicators as well as process indicators; moreover, indicators are best unified across sectors.
- Decentralization is not a sector, while it was treated as such in Uganda with a Sector Working Group, a Sector Investment Plan, and specific donor support. Decentralization of service delivery affects all economic sectors and should be supported in a harmonized way across sectors and donor programs.
- Many conditional grants to local governments are funded through donor programs. A fully decentralized sector allocation, supported through government budgets, however, requires changes to ways of donor fund allocations across sectors, given that such allocations cannot be determined a priori. This is even more important if local governments and communities have authority to do so, while, on the other hand, incompatibilities exist in this regard, such as those related to development cooperation frameworks or to sector-specific earmarking of funds by teams.

IEG's PPAR on the **Dominican Republic Public Finance and Social Development DPL** yielded five key lessons:

- The imperative to respond at a time of crisis can conflict with starting a dialogue on requirements for longer-term reform.
- An overly complex design without short-term indicators that can be monitored can detract from efficacy.
- In light of the previous two lessons, a Development Policy Loan may be the wrong instrument to support a country in a financial crisis.
- The lack of updated political economy analysis can hamper reforms and value added by the World Bank.
- A critical mass of Bank interventions in a country can act as a "shock absorber" for shortcomings in individual operations and help deliver results at times of crisis.

The following lessons from IEG's PPAR on the **Nigeria Community-Based Poverty Reduction Project (CPRP)** are relevant to the EFI cluster:

- Community-based initiatives need to be integrated and coordinated with government's broader poverty reduction strategy to effectively tackle poverty reduction. The CPRP was overall successful in increasing access of poor rural communities to water, education, and other social and economic infrastructure. However, to achieve profound and lasting impacts on poverty reduction, key elements include greater collaboration and partnership of communities with local government authorities, as well as active support of by relevant sectoral ministries.
- For micro-projects to be sustainable in the long run, the community-based development approach needs to engender and nurture a strong relationship between local communities and government at all levels.
- Development projects – including community development projects – need to be coherent and complementary. This complementarity can originate within the project itself through harmonization across different projects, or coordination between the community-driven development approach and the government provision.
- The monitoring and evaluation (M&E) framework is especially crucial for community-based development projects. The CPRP is an example of a project that was likely more successful than the M&E data can possibly tell. However, very little was collected on targeting, the participatory process, and impacts on the well-being of the communities.
- There is limited evidence that women's needs were properly represented in the selection of the CPRP micro-projects. A constant effort was made to ensure that women were included in community decision-making and women's associations were encouraged to present proposals of their own. Moreover, the type of projects allowed for funding by the CPRP was especially pro-poor and generally managed in an inclusive way.

The lessons from IEG's PPAR on the **Mozambique Public Sector Reform Project** are:

- Public sector reform operations need to consider sustainability of leadership commitment. Political commitment is multi-dimensional comprising several elements, such as clear enabling policies, time-bound implementation strategies, adequate resourcing, and inclusive citizen participation.
- The reform program's ambition must fit the country's capacity and technical assistance needs. In Mozambique, part of the program was well designed to focus on quick wins that would visibly generate public support, help sustain commitment, and can help motivate service providers. However, the legal

reform element was too complex and lacked adequate technical assistance to keep it on track.

- In contexts where there is joint donor support, the Bank should aim to also provide its support through this fund. Using the same processes for accessing funding from the Bank as for other funding reduces transaction costs for government, and helps ensure that the Bank's resources are promptly disbursed.
- Both leadership commitment and capacity have implications for M&E. In situations of low commitment and capacity, the Bank needs to spend extra effort to select and link measurable indicators to objectives, and obtain baseline data at the outset. M&E needs to be owned by project managers to support real-time adjustment to projects through the use of feedback mechanisms, and to ensure that results are broadly understood, and used to widen support for reform.

---

<sup>1</sup> This section focuses on the World Bank's portfolio, while some Global Practices may be jointly managed by World Bank and IFC. Lessons from IFC operations relevant to this cluster are summarized under the Main Evaluation Findings and Lessons section.

<sup>2</sup> Findings and lessons related to PPP, IFC, and MIGA operations relevant to the EFI cluster have been included in this section even though they may not be under the direct responsibility of the EFI cluster.

## Human Development Global Practice Cluster

The Human Development cluster consists of the following three Global Practices:

- **Education:** seeks to build more relevant skills for productivity and employment, better health and more education for future generations, and better citizenship and stewardship of natural resources (guided by the Education Global Practice strategy Learning for All, and capitalizing on the World Bank Group's leadership role in building evidence for a systems approach to reforms and investments)
- **Health, Nutrition, and Population:** aims to accelerate progress toward universal health coverage to ensure that by 2030, the poorest 40 percent of the population will have access to essential health, nutrition, and population services, and that people will not fall into or stay in poverty because of health care expenditures
- **Social Protection and Labor:** seeks to help individuals and families manage risk, cope with chronic or transitional poverty, and gain access to better livelihoods and jobs.

The Human Development cluster is the World Bank's smallest Global Practice cluster by commitments. Commitments in FY15 were \$9.3 billion, which is 22 percent of the total Bank lending (table 3). In comparison, total commitments for the largest cluster – Sustainable Development were \$22 billion, (52 percent of the total Bank lending). The commitments for Equitable Growth, Finance, and Institutions cluster were \$11 billion (26 percent of the total Bank lending).

### PERFORMANCE TRENDS

During FY12–14, ratings for 73 percent of those 192 closed investment projects were moderately satisfactory or higher (MS+), compared to 68 percent for other clusters (figure 1). During FY05–13, the Human Development cluster's percentage of its total number of projects that were rated as MS+ have been consistently lower than those of the Equitable Growth, Finance and Institutions and Social Development clusters. The spread was widest in FY08 and FY09 at about 20 percent, but have almost equalized in recent years. In FY14, the trend was reversed, with 73 percent of Human Development projects rated MS+, compared to 68 percent for the Equitable Growth, Finance and Institutions and Social Development projects.

A specific look at development policy operations show a similar trend (figure 2). DPOs in the Human Development cluster consistently had a lower percentage of its total number of DPOs being rated as MS+ compared to the Equitable Growth, Finance and Institutions and Social Development clusters taken together. As from FY10–12, however, the trend was reversed: the Human Development cluster's DPOs showed larger percentages each year (on a three-year moving average) with ratings MS+

compared to the DPOs of the Equitable Growth, Finance and Institutions and Social Development clusters, that is, 81, 87 percent in FY11–13, and 96 percent in FY12–14.

Regarding financing source, IBRD-financed investment projects in the Human Development cluster performed better than IDA projects from FY05–07 (figure 3). In FY07–09, the trend was reversed.

During FY12–14, over 90 percent of the investment projects in the Social Protection and Labor Global Practice were rated MS+, compared to 74 percent for Health, Nutrition, and Population Global Practice, and 65 percent for Education Global Practice (table 1).

Disaggregated by Regions from FY12–14, more than two-thirds of Human Development projects in all Bank Regions except one were rated MS+, ranging from 62 percent in Europe and Central Asia, to about 80 percent in both the East Asia and Pacific and Latin America and Caribbean Regions, to a high of 90 percent in the South Asia Region (the figure for Middle East and North Africa Region is 58 percent) (table 2).

Regarding monitoring and evaluation (M&E) quality for Human Development projects that closed FY11–14, only the Social Protection and Labor Global Practice had 54 percent of projects rated as substantial. The Education and Health and Nutrition GPs showed low levels of 25 percent and 27 percent of their respective total projects rated as substantial for M&E quality. Overall, for Human Development projects taken together, only 32 percent were rated as substantial for M&E quality.

#### MAIN EVALUATION FINDINGS AND LESSONS

This section summarizes key findings and lessons from IEG's major evaluations, learning products, and Project Performance Assessment Reports (PPARs) completed during FY12–15 and relevant to the Human Development cluster.

#### MAJOR EVALUATIONS AND LEARNING PRODUCTS

##### *Education*

IEG is in the process of evaluating the World Bank Group's support for higher education. The evaluation will focus on both public and private sector investments, knowledge products, and advisory services (FY04–15). The evaluation will start by analyzing the consistency and articulation of the Bank Group's support, focusing on how operation are designed and coordinated. The evaluation will also analyze the Bank Group's contribution to strengthening the higher education system, including its impact on the public and private sector development and quality assurance as well as its contribution to improving internal efficiency in universities. Finally, it will evaluate the

Bank Group's contribution to social and economic outcomes through higher education. This includes its impact on poverty, gender equality, and disadvantaged groups.

### *Health, Nutrition, and Population*

IEG's **World Bank Support for Early Childhood Development** (IEG 2015j) examined the Bank's design and implementation of operations (FY00–FY14) that support interventions for young children and their families. The evaluation found that the Bank has produced analytical work devoted to topics such as maternal and child health, nutrition, and early childhood development (ECD), which causes and underpins subsequent lending. Country experience reveals the importance of the Bank's policy dialogue, suggesting that it can be leveraged in countries where the Bank has limited financial involvement, and help to promote understanding of the contribution of ECD to breaking the intergenerational transmission of poverty. The Bank invests heavily in maternal and child health interventions to improve both survival rates and physical development. But to break the cycle of poverty children must also have the cognitive, linguistic, and socio-emotional maturity to be able to succeed in school and in the workforce. Impact evaluation evidence shows that child stimulation in the first three years of life, childcare, parenting education and support, screening and treatment for disabilities, and reduction of maternal depression are important and effective interventions in many contexts. However, these are largely overlooked by the Bank and other development partners. The challenge for the Bank and its partners will be to go beyond a focus on health and survival to ensure that health, nutrition, and social protection systems give parents the tools they need for optimal parent-child interactions. The evaluation recommends that the Bank adopt arrangements that will provide a well-coordinated and strategic framework for ECD; use analytic work on ECD in the preparation of Systematic Country Diagnostics to determine need; increase knowledge to address key ECD operational challenges; and improve the monitoring and evaluation of ECD intervention.

For its learning product on **Maternal and Child Health** (IEG 2013b), IEG reviewed 68 Bank and non-Bank interventions from any sector in a low- or middle-income country with an impact evaluation completed between 1995 and 2012 that reported effects on at least one of five maternal and child health outcomes – skilled birth attendance or maternal, neonatal, infant, or under-five mortality. The review found that appropriately designed interventions are more likely to yield significant results in countries with a larger burden such as lower skilled birth attendance rates or higher mortality. Lower socioeconomic status households realized larger benefits from these interventions, but utilization among the poor remains a challenge.

IEG assessed the World Bank's **Support for Health Financing Reform** (IEG 2014g). Over FY03–12 the World Bank supported health financing reforms through 188 operations in 68 countries. Health financing interventions were in about 40 percent of the Bank's Health, Nutrition, and Population portfolio. Accompanying Bank lending operations is a large body of analytical and advisory work, knowledge products, technical assistance, and training programs. Five key findings and recommendations emerge. First, technical capacity and government commitment greatly facilitate reform. The report recommends that the Bank continues to support government commitment and build technical and information capacity in countries. Second, the poverty and equity effects of health financing need more attention. Analysis should address health financing as a cross-cutting issue, consistent with the aim of promoting universal health coverage. Third, health financing requires a different skill set. IEG advises that Global Practices expand staff technical capacity and focus on health financing as a comparative advantage. Fourth, collaboration across public sector and health teams, as well as between the Bank and IFC has been limited. An integrated approach that links health financing with public sector reforms is likely to be more effective than single-issue interventions. Finally, the quality of monitoring and evaluation is weak in Bank and IFC operations. It needs to be strengthened to better analyze the impact of Bank and IFC operations on final outcomes.

For its learning product on **Impacts of Interventions during Early Childhood on Later Outcomes** (IEG 2015c), IEG reviewed causal evidence from 54 studies to investigate the post-early childhood effect of early childhood interventions in low- and middle-income countries to determine whether benefits persist into school age and beyond. The review found that early childhood interventions can, but do not always, lead to benefits later in life in the areas of cognition, language, education, and the labor market. Evaluated interventions have not shown consistent long-term advantages for physical development, although these outcomes are less salient to adult welfare. To take advantage of the window of opportunity from conception to the child's second birthday and achieve sustained effects beyond early childhood, nutrition interventions may need to be in place throughout and beyond these first 1,000 days. Sizeable knowledge gaps persist but can be closed with careful planning and design.

### *Social Protection and Labor*

For its learning product on **Social Safety Nets (SSNs) and Gender** (IEG 2014e), IEG conducted a systematic review to analyze impact evaluation evidence on the effect of SSNs on gender-related results such as increasing women's bargaining power and decision-making, improving education outcomes of boys and girls, and promoting maternal and child health. The review also analyzed gender integration in the World Bank's portfolio of SSN interventions. It found that men and women respond to and

benefit from safety nets in different ways and not everybody in the household benefits equally from SSN, since men and women and boys and girls have different roles, responsibilities, and constraints and typically respond differently to incentives. The evaluation highlights the need at preparation to identify expected and desired gender results and address them in the project. This may imply targeting explicitly girls, setting up a different payments for boys and girls, or to use a conditional cash transfer instead of an unconditional one. Projects also need to collect more gender-disaggregated data in project M&E. This would ensure tracking gender issues identified at the design stage and permit a better understanding of the project's impact, and potentially correct what would otherwise have been unintended differential impacts.

#### PROJECT PERFORMANCE ASSESSMENT REPORTS

##### *Education*

IEG has carried out a number of PPARs focusing on higher education to inform an ongoing major evaluation of the World Bank Group activities in this subsector.

In **Indonesia-Managing Higher Education for Relevance and Efficiency Project**, the Bank supported an ongoing reform of the higher education system through a combination of IBRD and IDA funding. The project sought to promote efforts to improve quality, relevance, efficiency, and equity in the higher education system. The PPAR found that while the project was largely successful in supporting the government at the central level, it proved more difficult to monitor the impact at the university level. There were many challenges in implementing the grant programs successfully and many universities lacked the capacity to comply with the Bank's procurement guidelines. The Bank's experience highlighted the importance of properly incorporating political risk in project design, monitoring and evaluation, and decentralized training early in the project.

IEG's PPAR for **Vietnam-Higher Education Project II** found that the project was successful in increasing the relevance of participating universities, supporting many high-quality research projects, and increasing the capacity of researchers and instructors. Graduates also benefitted and were also more likely to work in their chosen professions or attend post-graduate study both domestically and internationally. Overall, the project was administered efficiently with very proactive support from the government and the Bank. It took full advantage of a strong M&E system to reallocate resources as needed. The project provided a good example of (i) how the Bank can use an investment project within the context of a larger reform program and multiple Bank interventions, and (ii) how a well-designed M&E framework can contribute to implementation.

In **Nicaragua Education Project**, the Bank provided support to basic education. As originally designed, the project focused on the government’s reform program, which promoted the development of autonomous schools. IEG’s PPAR found that while the original project design was not adequate to meet the original ambitious objective, the restructuring gave the project a more realistic set of objectives while better organizing the activities. The project was particularly instrumental in improving donor coordination and strengthening the capacity of the Ministry, in particular the quality and timeliness of the M&E system. Although the project contributed to the development of learning assessments, data on learning remains elusive. The project’s contribution to improving governance and accountability, was limited. The project’s experience highlights the importance of flexibility in the face of political changes.

IEG’s PPAR for **Nigeria State Education Sector Project**, whose objective was to improve basic education quality and girls’ participation in Kano, Kaduna, and Kwara, found several weaknesses. Aspects to improve education quality and learning outcomes – such as addressing the unequal distribution of teachers among schools particularly rural ones – were ignored. There were few targeted activities to increase the participation of girls. The conditional cash transfer pilot implemented in Kano only supported the first grant payment to girls. The pilot continued with the support of the UK Department for International Development and the Kano State Ministry of Education, but its future was uncertain. The project’s experience highlights several lessons. Learning and sustainability of pilot activities are limited when there is an absence of clear design, an explicit evaluation mechanism, and a sufficient implementation time frame. Improving inputs into learning (facilities, textbooks, and the like ) needs to be accompanied by defining and addressing quality requirements in terms of minimum standards for student learning.

In **Dominican Republic Early Childhood Education Project**, the Bank provided support to increase access and quality of the ECD services for all children ages zero to five. IEG’s PPAR found that teacher training was provided to 3,931 teachers, there were reductions in repetition rates in grades three and four, and 19,500 new spaces for pre-primary students were created. However, there was only a modest increase in enrollment and an underutilization of classrooms in Model Centers. The project’s lessons are:

- Lack of attention to country context in project design can lead to considerable delays and inefficiencies.
- Greater proximity to pre-primary education is necessary but not sufficient for poor parents to enroll their children.
- Under-enrollment of 5-year-olds in the new capacity suggests that significant constraints remain for poor parents to enroll their 5-year olds in pre-primary

education, which points to the importance of understanding the most critical constraints affecting pre-primary enrollment.

The World Bank took part in a sector-wide approach (SWAp) for the **Bangladesh Primary Education Development Program II**, which was carried out with the support of 10 development partners, coordinated by the Asian Development Bank. IEG's PPAR found that coverage improved, particularly for poor students, students with disabilities, and ethnic minorities. The program also focused on education quality and contributed to the increase in learning assessment results. However, there are still significant differences between regions and socioeconomic groups. The program made a major contribution to strengthening the sector-wide M&E capacity.

### *Health, Nutrition, and Population*

IEG's PPAR for the **Albania-Health System Modernization Project** made the key finding that attempts to simplify indicators during the project restructuring weakened the M&E design. The Bank's support was to improve access to high-quality primary health care services, capacity to formulate and implement health policies and reforms, and hospital governance and management. Special emphasis was placed on the poor and underserved areas, and on the reduction of unnecessary use of hospitals through improved primary health care services. In the original design, the results chain was largely supportive of the achievement of project objectives. However, M&E implementation fell short of expectations because of the lack of timely, reliable data and ill-defined indicators. Even though project M&E did not generate reliable data for decision-making, the performance data developed under the Health Insurance Institute performance-based bonuses for primary health care had a positive effect on the use of data for decision-making, but the use was limited to the financing of bonuses. There was no use of data at district, regional or central levels to assess overall trends or to use them to enhance progress toward the project objectives.

The **Bangladesh Health, Nutrition, and Population Sector Program (HNPSP)** was the second in a series of SWAps in the health sector since 1997. HNPSP provided support to most aspects of the sector, ranging from support to hospital and clinics, vertical programs, family planning, and nutrition interventions. IEG's PPAR found that HNPSP was largely successful in achieving its goal, particularly in lowering the fertility rate and supporting disease-specific programs. Although the mortality rate decreased, there was little or no impact on nutrition outcomes. Experience from the program showed the negative consequences of having overambitious objectives and an inconsistent results framework.

IEG's PPAR for **FYR Macedonia-Health Sector Management Project** highlighted the importance of closely coordinating policy and investment lending to facilitate achievement of reforms. The Bank's support upgraded the capacity of the ministry of health and the Health Insurance Fund to formulate and effectively implement health policies, and to develop and implement an efficient scheme of restructuring of hospital services, with an emphasis on developing day-care services and shifting to primary care. The PPAR found that the institutional capacities of the ministry of health and the Health Insurance Fund improved only modestly, but restructuring hospital services was substantially achieved. Economic analyses show that the project's net benefits far outweighed its costs in the areas of revenue collection and expenditure management, indicating substantial efficiency. Project design was strong, but it did not wholly anticipate potential difficulties with political and institutional arrangements that later proved problematic. Intensive supervision was required, particularly to guide a difficult process of procurement, testing, and delivery of information technology equipment before closing.

IEG prepared a cluster PPAR for **Indonesia Provincial Health I, Provincial Health II, and Health Workforce and Service Projects**, in which the Bank supported decentralization within the health sector by developing leadership and setting standards in the ministry of health, strengthening technical support and quality control functions in selected provinces, and building local planning and implementation capacity at the district level. IEG's PPAR found that the projects did not achieve their objectives. Decentralization did not proceed as expected. A large measure of authority was retained at the center; provinces essentially became extensions of the central ministry; and although districts did cut loose from the center as accountability refocused on district authorities and local populations, their control over resources was circumscribed. The project highlights the importance of client ownership of reforms. Successful introduction of new institutions requires that clients (the ministry of health and subnational governments) understand the changes sought, believe they are feasible, support them, and are ready to pursue them. This requires collaborative project development and continuous socialization of the project among participants to ensure that the client understands what is going on, supports it, and ultimately owns it.

### *Social Protection and Labor*

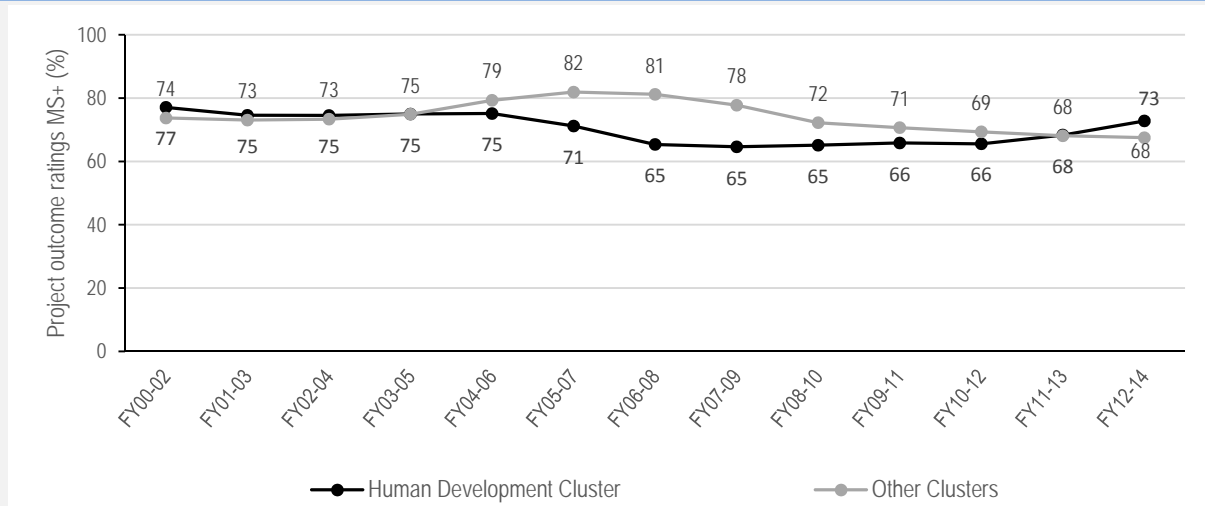

IEG's PPAR for **Nigeria Community Development Project** highlighted the importance of integrating community-based initiatives into the broader poverty reduction strategy, and creating relationships between local communities and governments at all levels to sustain micro-projects. The project's objectives were to improve access of the poor to social and economic infrastructure, and increase the availability and management of development resources at the community level. Most of the funding supported

community-based initiatives to build and restructure basic social and economic infrastructure by creating independent state-level social funds for micro-projects that met specific selection criteria, such as broad community participation in project selection and a matching contribution from communities. IEG's PPAR found that although the project succeeded in increasing the ability of poor communities to control and manage funds for their own development activities, it did not create strong and lasting linkages between government and local communities. There is only limited evidence of an increased number of federally supported programs using community-based initiatives or an increased number and quality of community-based activities undertaken by states, which raises doubts about the approach being fully embraced at the institutional level.

The **Albania-Social Sector Reform Development Policy Loan** supported policies to improve the administration of social assistance programs and promote the use of systematic formulas to allocate resources in selected social programs and services. IEG's PPAR found that the objective to support policy changes to improve the effectiveness of social safety nets was substantially achieved. The government established a sound legislative framework for improving the effectiveness of social safety nets. While improved equity of health spending and other ambitious outcome indicators established under the DPL have not yet been achieved, strong government commitment and good implementation progress provide strong indication that they are likely to be achieved. The experience of this operation shows that one-tranche DPLs can be transformative and support reform momentum if they build on solid analytic work, effectively use critical policy change that may not gain sufficient traction through sector dialogue alone, and are supported by continuity in the sector policy dialogue and lending after the DPL closes.

## Sustainable Development Global Practice Cluster

The Sustainable Development cluster consists of the following six Global Practices:

- **Agriculture:** aims to link farmers to markets to increase food availability and stimulate general economic growth using a value chain approach, including on-farm inputs, land, water, financial services, and post/harvest agro-processing
- **Energy and Extractives:** sets priorities for improving the energy investment climate by promoting sector reform and governance, strengthening utilities, enhancing investment frameworks, encouraging private participation, and rationalizing subsidies
- **Environment and Natural Resources:** seeks to promote a green, clean, and resilient world in which natural resources are managed to support livelihoods and strong economies; and to share prosperity by transferring wealth from downstream beneficiaries of ecosystem services to upstream communities that carry the opportunity costs of protecting nature
- **Social, Urban, Rural, and Resilience:** gives priority to ensuring that marginalized and vulnerable populations have a voice in defining the growth of cities, human settlements, and rural areas, which have local and global implications for sustainability and climate change
- **Transport and Information and Communication Technologies (ICT):** seeks to improve connectivity and competitiveness by facilitating the movement of people, goods, and information to enhance food security; and to increase access to jobs, health, and education services
- **Water:** aims to ensure that water is a reliable foundation for poverty reduction and shared prosperity by delivering public water goods coupled with private initiatives to add value to water services throughout the water cycle.

The Sustainable Development cluster is the World Bank's largest Global Practice cluster by commitments. Commitments in FY15 were \$22 billion, which is 52 percent of the total Bank lending (table 3). In comparison, total commitments for the Equitable Growth, Finance, and Institutions cluster were \$11 billion (26 percent of the total Bank lending) and \$9.3 billion for Human Development cluster (22 percent of the total Bank lending).

### PERFORMANCE TRENDS

During the three-year period FY12–14, ratings for 70 percent of the 456 closed investment projects in the Sustainable Development cluster were moderately satisfactory or higher (MS+), which is comparable to the 67 percent for non-Social Development clusters (figure 1). During FY05–14, the percentage of the cluster's total

## APPENDIX F GLOBAL PRACTICE CLUSTER UPDATES

number of projects rated MS+ was consistently higher than that of the Equitable Growth, Finance, and Institutions and Human Development clusters. During FY07–09, the difference was the largest, in the range of 15 to 20 percent. However, those percentages narrowed considerably since FY11.

DPOs, however, show the opposite trend from FY05–13 – the percentage of DPOs rated MS+ in the Sustainable Development cluster was lower than in the Equitable Growth, Finance, and Institutions and Human Development clusters<sup>1</sup> (figure 2).

Investment projects in the cluster financed by IBRD from FY06 to FY09 were consistently rated better than IDA projects (90 percent versus 82 percent, respectively), measured as the percentage (on a three-year moving average) of total projects rated MS+ (figure 3). The percentages were almost equal for IBRD and IDA during FY10 and FY11 (72 percent). However, the trend reversed since FY12. The percentage of all closed IDA-financed projects in the cluster was higher than IBRD projects, and the gap is widening (in FY12–14, 77 percent for IDA projects and 64 percent for IBRD projects).

Investment projects in three Global Practices were rated about 75 percent MS+ or higher – Social, Urban, Rural, and Resilience, Agriculture and Transport, Information and Communications. The other Global Practices ranged from 50 percent to 68 percent – Energy and Extractive Industries (68 percent), Water (64 percent), and Environment and Natural Resources (51 percent) (table 1).

Disaggregated by World Bank Regions during FY12–14, Sustainable Development investment projects rated MS+ were 85 percent for the South Asia Region, 75 percent for Europe and Central Asia, and 70 percent for Latin America and Caribbean (table 2) (the other three Regions were at about 66 percent).

Regarding monitoring and evaluation (M&E) quality ratings for cluster projects that closed in FY11–14, the Energy and Extractives Global Practice had 44 percent of projects rated as substantial or higher, while the M&E ratings for the other five Global Practices ranged from 19 percent to 30 percent, with the Water Global Practice rating lowest in achieving M&E Quality ratings of substantial or higher (figure 4).

### MAIN EVALUATION FINDINGS AND LESSONS

This section summarizes key findings and lessons from IEG's major evaluations, learning products, and Project Performance Assessment Reports (PPARs) completed during FY12–15 and relevant to the Sustainable Development cluster.

## MAJOR EVALUATIONS AND LEARNING PRODUCTS

### *Energy and Extractives*

IEG completed a major evaluation on **The World Bank Group's Support to Electricity Access** (IEG 2015i). Closing the electricity access gap is essential to achieving the World Bank Group's goals of increasing shared prosperity and ending extreme poverty by 2030, and to its commitment (with the UN) to the Sustainable Energy for All (SE4All) initiative. This evaluation examined to what extent the Bank Group has been effective in supporting electricity access, and how well it is equipped to help its country clients progress toward achieving universal access to adequate, affordable, and reliable electricity. The study found that the development outcomes of the Bank Group's assistance were generally favorable compared with other infrastructure sectors, though there were significant gaps in the Bank Group's coverage of low-access countries, mostly in Sub-Saharan Africa. The study also found several good practice national access scale-up experiences worldwide, some with significant Bank Group involvement. Based on these findings, the evaluation recommends that the Bank Group decisively and intensely engage with low-access countries (mostly in Sub-Saharan Africa); move from a largely project-by-project approach to a sector-wide organizing framework and process for implementing rapid access scale-up; design an engagement strategy to enable low-access countries to mobilize sector-level investment financing on the scale required; and improve the evidence base related to electricity access.

### *Agriculture, and Environment and Natural Resources*

IEG's evaluation of **World Bank Group assistance to more than two dozen low-income fragile and conflict states (FCS)** (IEG 2013f) examined the links between conflict, fragility, and the management of high value natural resources. The attitude and perceptions of resource-affected communities are important for maintaining peace and stability in FCS where a failure to share the benefits of resource-related rents fueled conflict. World Bank-supported mining laws include community development clauses, but lack the means to empower local citizens and oversee implementation. IEG found that the Bank can be more effective in the following ways:

- Systematically building analysis of local social dynamics and historical grievances about land and resource use into the design of operations
- Tending to issues of elite capture and intergroup dynamics in local benefit-sharing arrangements
- Purposively including women and youth – often excluded from decision-making processes – in benefit-sharing deals

- More effort is needed to ensure that extractive industries support sustainable local and regional development. The evaluation also notes the need in FCS for greater collaboration across sectors and among the Bank, IFC, and MIGA.

IEG conducted a **Cluster Country Program Evaluation (CPE) in resource-rich Kazakhstan, Mongolia, and Zambia** (IEG 2015i) through the lens of the Extractive Industry Transparency Initiative, which has been an important multi-donor initiative in which the Bank helped to improve institutions and governance. All three countries became fully compliant by 2013. In Kazakhstan, the Bank's technical assistance built local capacity and encouraged citizen participation in governance discussions. In Zambia, the Bank's support to the Extractive Industry Transparency Initiative strengthened public access to information on mining revenues and the demand for reforms by building a coalition of local nongovernmental organizations (NGOs). However, IEG found that the benefits of the engagement are less than expected. Inadequate ownership of reforms is constraining the full use and enforcement of the newly created technical capabilities. Stimulating local demand for stronger government accountability was a particular weakness in the Bank programs IEG reviewed.

IEG produced a series of **Learning Products on Aspects of Development Policy Financing**, which examined results frameworks, macro-fiscal frameworks, and public expenditure reviews. A fourth product (forthcoming) examined how the Bank undertakes environmental and social risk management in its policy lending operations, as required under Operational Policy OP 8.60. This report conducted desk reviews on a random sample of development policy operations from 2005 to 2014 and found that although most policy actions did not pose risks, IEG identified significantly more risks than were noted by task teams. Risks were not confined to operations mapped to sectors such as energy, agriculture, and environment. Although some type of mitigation measure was usually included when task teams identified a risk, analytic work assessing these risks was not always performed, and capacity assessments of the ability of country systems to manage risks were often perfunctory. Completion reports rarely reported on whether negative effects occurred or whether mitigation measures were implemented. The main reasons for these findings include unclear guidance on key concepts, variation in user-friendliness of guidance, the lack of formal procedures for review, and staff incentives focused on rapid delivery. The report offers a number of suggestions for improving the risk management system. IEG will produce more learning products on political economy analysis and poverty and social impact analysis in FY16.

IEG produced a Learning Product on the **World Bank Experience with Avian Influenza**, which drew on a series of Project Performance Assessment Reports (PPARs) on avian influenza control projects in Albania, Armenia, Nepal, Nigeria, Romania, and

Tajikistan, and used these and additional analysis to draw a number of strategic and technical lessons. The experience showed the Bank's strengths in its ability to use its convening power, raise funds, work with partners, and rapidly prepare and supervise a global investment program – even in an area where the Bank once lacked expertise and experience. It also shows how the Bank can fail to continue supporting important global agendas once the spotlight has moved on, particularly for issues that do not fit neatly into existing institutional structures, strategies, and constituencies.

### *Transport and ICT*

IEG conducted a study on **Making Roads Safer: Learning from the World Bank's Experience** (IEG 2014b), a pioneering learning product produced in cooperation with the Bank's transport operational staff and the Global Road Safety Facility. IEG found that governments in several countries such as Argentina, China, Colombia, Nigeria and Vietnam have taken affirmative steps in road safety, with Bank support, although considerable challenges remain – in these countries, and Bank-wide. The study's key lessons conclude that road safety needs government commitment at the highest level, the support of local champions, and a strong coordinating entity – all of which can make a substantial difference for success and sustainability. The coordinating entity must be empowered to take decisions, have sufficient budget and staff capacity, and a clear mandate to coordinate road safety matters across numerous departments and agencies. In IEG's assessment, the Bank should be realistic about what it can achieve with its existing resources and how long the change process will take, given that historically only an average of 3 percent of transport project funding was committed to road safety activities.

IEG prepared a Learning Note on **Additional Financing for Transport and Information and Communication Technology** (IEG 2015f), which has important implications for the efficiency of service delivery, particularly on cost overruns. The Note covered 99 additional financing projects, including a more detailed review of 32 closed additional financing operations. The review found that projects with additional financing had better overall outcome ratings compared with the rest of the portfolio. However, not all projects maintained their performance after getting the additional financing resources, with 13 percent rated as moderately unsatisfactory or below (MU-) for overall outcomes at project closure. Because of substantial cost or time overruns, or both, 20 out of the 32 projects were rated modest for project efficiency. The M&E frameworks of 27 projects were also rated modest, suggesting that the additional financing stage was not fully used to improve the projects' results frameworks. IEG's main lessons on additional financing conclude that focusing on the engineering design at the preparation stage is important to avoid substantial cost overruns and the transaction costs of processing the additional financing, and that more caution is needed when using additional financing

to scale up complex projects or projects experiencing implementation issues. Furthermore, the Bank project team should use the additional financing stage to refine the project results framework.

#### PROJECT PERFORMANCE ASSESSMENT REPORTS

##### *Agriculture*

In **China**, IEG prepared PPARs for three Bank-supported projects – **Irrigated Agricultural Intensification III (IAIL3)**, **Mainstreaming Climate Change Adaptation (MCCA)**, and **Hai Basin Integrated Water and Environment Management (HBP)**. Northern China faces severe and increasing water stress. Groundwater is unsustainably drawn down because demand from agriculture (the main user) is increasing while rainfall is declining. Climate change will bring further stresses. Meanwhile, pollution loads exceed tolerable levels. IEG’s PPAR found that the projects successfully introduced innovations to improve water use sustainability. At the farm level, IAIL3 promoted engineering, agronomic, and management techniques that boosted land and water productivity. The associated MCCA mainstreamed techniques that increase cropping resilience to climate shocks, now and in the future. HBP introduced the crucial idea of capping total evapotranspiration (consumptive water use); supported design and implementation of county and basin-wide integrated water use plans; and developed a sophisticated remote-sensing methodology for tracking evapotranspiration. Together these projects offer generalizable lessons on water management and climate adaptation.

IEG evaluated three projects on **Tunisia agricultural support services and natural resource management**. The Tunisia Agricultural Services Project aimed to address the need for better quality agricultural services that are relevant to the challenges of market-driven agriculture. In the past, government policies and agricultural services focused exclusively on maximizing production volume, but new trade agreements created a need to increase the quality and competitiveness of products to take advantage of potential new markets and to compete with new imports. The project also aimed to support a more demand-driven approach in providing agricultural services. The project improved quality standards for some agricultural products and led to greater understanding of international market demands; laboratory upgrades enhanced the ability to meet international quality standards, and agricultural research was made more responsive to stakeholder demand. The project was less successful at promoting private sector participation in providing extension services. Additionally, the benefits of working through producer associations were not realized since the associations lacked buy-in and ownership of their members. The lack of complementary policy reforms to improve incentives hampered the overall impact of project achievements.

The **Tunisia Natural Resources Management and Northwest Mountains and Forest Areas Projects** aimed to address land degradation and enhance local socioeconomic conditions. Both projects combined support for the construction of soil and water conservation works, financing for agriculture and non-farm income-generating activities, and the construction of basic rural infrastructure. Both used an integrated participatory approach to engage communities in the local development planning process. One lesson shared by both projects is that weaknesses in the structures used to integrate communities into the development process can undermine long-term community collaboration. Community organizations need sufficient legal standing to ensure their legitimacy in representing community priorities to government agencies; communities must view the leaders of such organizations as legitimate; and all segments of the population should be represented. Both projects also included alternative income generation activities that yielded limited results because support was limited to training and technical support for production issues. Insufficient attention to markets and ensuring the availability of credit also limited results. The assessments also highlighted the need for greater attention to improving project M&E. Despite three decades of World Bank support to integrated rural development projects with significant investments in soil and water conservation, no assessment was made to determine the impacts of these interventions on erosion, soil fertility, groundwater recharge, or dam siltation.

IEG assessed two sustainable fisheries management projects in **Senegal** aimed at improving the governance and management of marine and coastal resources. The first project “**Integrated Marine and Coastal Resources Management Project**” was designed to apply a coordinated ecosystem approach to the management of the fisheries sector under the jurisdiction of two separate ministries that would bring together stakeholders concerned with fisheries management and those involved with biodiversity conservation. The coordinated approach proved unworkable, and ultimately the two agendas were implemented separately. The project’s ecosystem management activities resulted in a temporary boost in protected areas management capacity, but few activities continued beyond the project’s closure. A second parallel operation, **Sustainable Management of Fish Resources Project**, further promoted the fisheries management agenda. The projects’ main achievement was successfully piloting the use of legally recognized co-management agreements with local communities that allow them to regulate a designated fishery. The targeted fisheries showed some signs of recovery and the government adopted co-management as an official tool for implementing fisheries sector policy. Further support to strengthen and expand this co-management model is under the ongoing West Africa Regional Fisheries Program. The assessment highlights the importance of a long-term approach to tackling a politically sensitive and inherently slow reform process, the challenge of working

across institutional and ministerial boundaries, and the importance of adequate enforcement rights.

IEG piloted a series of participatory performance assessments of community-driven development and rural livelihood projects in Sri Lanka, Nigeria, and India in the past fiscal year and will continue to roll out this approach in the Lao People's Democratic Republic (Lao PDR), Ethiopia, and Mozambique this year. The pilots are part of an effort to increase citizen participation in evaluation (especially for projects implemented directly by local stakeholders), and to strengthen evaluation capacity within the communities in which the Bank is working.

In **Nigeria**, IEG evaluated the **second phase of the Fadama program** using a Social Capital Integrated Questionnaire to learn how the project's empowerment aims contributed to welfare gains. The evaluation found that the objective of fostering cooperation between competing resource users was highly relevant; however, gains skewed in favor of one type of group (farmers) over others, and enhanced technical assistance was needed to improve the profitability and sustainability of the project's income-generating activities. The program lacked a sustained, institutional approach; by the end of the second phase, the program had not adequately addressed the critical issue of strengthening local government capacity.

In **Sri Lanka**, IEG revisited the **Gemi Diriya villages** support five years after project closing. A survey of 500 households found that the Gemi Diriya institutions showed high resilience, but the national rural poverty reduction program (which absorbed the current phase) did not adopt many of the effective instruments used to alleviate poverty (such as targeting and social accountability). The program implemented many effective and innovative features such as participatory poverty mapping and village scorecards, which projects outside the region have since replicated.

In **India**, IEG's assessment of the **Andhra Pradesh Rural Livelihoods Programs** found that the programs helped more than 10 million women fulfill their most critical social and economic needs. Participation in project-supported self-help groups connected the poorest of the poor to key social entitlements and provided a collective voice for women to contest practices that blocked these entitlements. Participants gained access to significant savings and, in many cases, linkages to the formal banking system. However, loan waiver promises made during an election cycle after project close jeopardized the financial sustainability of the built system and threatened to undermine the credit discipline achieved. Going forward, the quality of technical assistance to support more profitable and sustainable investments in rural productive enterprises needs more attention.

### *Energy (Electricity Access)*

IEG has carried out several PPARs related to electricity access. IEG assessed the **Bangladesh Rural Electrification and Renewable Energy Development Project**, which targeted rural areas. An innovative output was the installation of about 1.24 million solar home system units, which far exceeded original targets and any other effort of this kind worldwide. A key lesson was that off-grid household electrification could cost-effectively accelerate the benefits of lighting to populations that face uncertain waiting periods for grid-based electricity or that are unlikely to obtain grid-based electricity due to remote or inaccessible locations.

In **Vietnam**, IEG conducted a cluster PPAR for the **Transmission, Distribution and Disaster Reconstruction Project, the Rural Energy Project, and the System Efficiency Improvement, Equitization, and Renewables Project**. These projects addressed the triple challenge faced by Vietnam's rapidly growing economy during the last two decades: ensuring universal electricity access while also strengthening the reliability and efficiency of the transmission and distribution network, and reforming the sector's institutional and regulatory frameworks. Lessons from IEG's assessment include:

- The Bank should emphasize broader institutional and policy measures for cost recovery to support a move toward long-term financial viability and fiscal sustainability.
- By contrast, specific target-oriented and time-bound measures such as tariffs or financial performance covenants carry excessive political implementation risks and are prone to noncompliance by the borrower.
- Rapid growth in electrification can be accompanied by suboptimal electricity use, especially in cases of low or subsidized tariffs, which call for early and serious policy attention to improving energy efficiency.

Inclusion of remote communities was the objective of some projects that IEG evaluated. The **Sri Lanka Renewable Energy for Rural Economic Development Project** used off-grid renewable energy technologies to provide energy services to remote communities. IEG's PPAR drew the following important lessons:

- Local participation and involvement, suitably incentivized, is crucial to promoting distributed power generation activities.
- Involving the private sector effectively in a decentralized developmental effort requires flexibility in implementation arrangements and space for adapting to market conditions.

- Investments in off-grid electrification could be underused or even abandoned if the electricity grid arrives sooner than expected. To mitigate this, grid expansion should be suitably coordinated with off-grid investments.

Social inclusion was also pursued in the electricity sector of **Bangladesh**, where IEG evaluated a cluster of three projects that addressed priority needs in the energy sector with the overall goal of raising levels of social development and economic growth. The **Technical Assistance Project** sought to improve the government's capacity for formulating power sector policies, and the **Development Policy Credit** focused on enhanced governance and accountability, and on financial stability in the sector that would lead to better and more sustainable service provision. The key lesson for these projects was that one-off technical assistance or credit support operations should be highly strategic, selective and practical in supporting policy and institutional issues of a complex nature. The **Rural Electrification and Renewable Energy Project** showed that a public-private partnership model can efficiently deliver large-scale and dispersed off-grid electricity services, by deploying public funding through private sector stakeholders.

IEG prepared a cluster PPAR for three projects in **Croatia** – the **Energy Efficiency Project**, the **Renewable Energy Resources Project**, and the **District Heating Project**. These projects aimed at reducing emissions of greenhouse gases, by promoting energy efficiency and developing renewable sources of energy. A key lesson from IEG's PPAR is that a supportive regulatory environment is crucial for: (i) overcoming risk aversion to adopting new financing instruments for energy efficiency projects; (ii) creating a level playing field for a competitive energy services company market; and (iii) establishing reliable means for verifying energy savings to provide a clear basis for sharing the resulting gains between the beneficiary and the financing source, thus incentivizing energy efficiency efforts. Also, the government needs to play a role in coordinating its various ministries to provide common technical and other support services, and to mitigate risks for investors and consumers in renewable energy efforts.

### *Environment and Natural Resources*

#### *a. Environmental Development Policy Loans (DPLs)*

IEG prepared a cluster PPAR for a programmatic DPL, **the Ghana First, Second and Third Natural Resources and Environmental Governance Projects**, which addressed policy issues in the forestry, mining, and environmental management sectors. Progress was made on increasing revenue collection by the forestry agency, changing royalties to increase revenue collection from large-scale mining, improving relationships and interaction between government and civil society on governance, and incremental

improvements on environmental impact assessment and strategic environmental assessment. However, a planned increases in forestry royalty rates were not implemented by the government following industry lobbying. Also the wood tracking system was not completed. Though the program improved transparency of fee payments and aimed to address social conflict issues, it did little to address informal forestry or small-scale mining, and forest degradation continues. The program highlights some of the advantages and perils of harmonized budget support: it can help to provide a unified platform for sector reform, but can reduce the flexibility of programs, and differences in rules and expectations across agencies pose significant challenges. It also showed the need for complementary technical assistance and support for reform efforts, and the challenges of single year operations in a programmatic DPL series for complex reforms that take time to implement.

In **Turkey**, the Bank's **programmatic DPL series** to support electricity sector policy reforms was later restructured and expanded to include environmental and climate change pillars and objectives and broader energy sector goals. IEG's PPAR found that the electricity pillar was well designed; it was based on a long history of investment lending and engagement with the shared parties and solid analytic work, and featured a coherent design of mutually reinforcing policy actions. In this sector, the Bank's DPL helped the government to set priorities for and sequence its reforms, and its involvement and reputation added credibility to the reform process for private sector investors. As a consequence, the electricity sector was very successful, and contributed to high levels of investment in electricity generation including renewable energy, and to a general avoidance of supply-demand imbalance. However, the environmental pillars added into the program were less successful. The selection of policy actions was less strong, and the Bank's DPL was not a major influence on policy reforms, which were motivated primarily by EU harmonization goals. A DPL may not have been the best instrument for environmental engagement, as the main barriers to improved environmental management were in implementation and enforcement capacity of environmental agencies, rather than weaknesses in policies or regulations.

IEG evaluated two **Brazil DPLs**—the **First Programmatic Reform Loan for Environmental Sustainability (2004)**, and the **First Programmatic Development Policy Loan for Sustainable Environmental Management (2010)**. The operation was designed as a programmatic series, aiming to increase the effectiveness and efficiency of environmental management systems, and to mainstream environmental sustainability in sector policies and programs. The DPL was based on solid analytical work, and was praised for in-depth engagement with government counterparts and extensive stakeholder consultations. The programmatic series was not continued after the first operation. But despite this, the DPL contributed to significant environmental policy reforms that led to positive outcomes—such as raising the profile of the environmental

agenda in the Brazilian Federal Government and substantially reducing deforestation in the Amazon. However, no Implementation Completion Report was produced for the program, which meant an important learning opportunity was missed.

The **Brazil Sustainable Environmental Management DPL** (2010) aimed to strengthen environmental management in Brazil, and included prior actions that targeted a number of key environmental sub-sectors. IEG's PPAR found that the SEM DPL was hastily prepared, with little time for engagement, a disjointed design, and gaps in analysis. A number of the prior actions in the operation had either been carried out before the preparation of the DPL began or were similar to those in the previous series, calling into question the contribution of the loan to the objectives. While Brazil has made substantial progress in improving environmental management in some areas, there is little evidence that this was related to the Bank's DPL. One important goal of the DPL had been to strengthen environmental and social safeguards of the Brazilian National Bank for Economic and Social Development (BNDES) to which the funds were on-lent by the government, but there has been little discernible improvement in the performance of its environmental management systems. Bank Management and the borrower disagreed with many of these findings, and so the evaluation includes a substantial management response and comments from the borrower.

*b. Ecosystems Management*

IEG assessed two sustainable land management projects in South Eastern **Brazil**. The objectives of the **São Paulo Restoration of Riparian Forests Project** were to arrest and reverse land degradation processes in riparian ecosystems and adjacent agro-ecosystems by increasing on-the-ground investments and strengthening the policy, regulatory, economic, and institutional incentive framework to encourage sustainable land management. The project generated studies, reference materials and tools to support riparian forest restoration, and these studies contributed to positive changes in public policies. But there is spotty evidence on the application or use of the project's tools and reference materials and there is no systematic evidence of outcome level achievements. The project was also expected to contribute to the application and multiplication of restoration practices by working through NGOs at the grassroots level. The capacity of some participating NGOs was strengthened and some NGOs that took part in the project continued to use the approaches piloted under the project while there has been no continuity by others. There was little evidence that land degradation was arrested or reversed. The **Rio de Janeiro Sustainable Integrated Ecosystem Management in Production Landscapes of North-Northwestern Fluminense Project** supported implementation of the Rio Rural program which promotes sustainable development in rural areas of the State of Rio de Janeiro by using a participatory approach to promote integrated ecosystem management. The project succeeded in

putting in place a system to enhance stakeholders' organizational capacity for sustainable land use planning, which in turn has encouraged the adoption of sustainable land management practices by beneficiary land holders. It also contributed to strengthening the policy environment in support of sustainable land management practices by catalyzing the signing of a decree that obligates the State to financially support a Payment for Environmental Services system within the State's Water Resources Management Policy. However, at the time of the assessment mission, which was conducted one year after project closure, there was little evidence to show that the sustainable land management interventions financed by the project have generated the global environmental benefits that the project set out to achieve. Both projects faced similar design and implementation challenges. Each had inconsistencies between their formal stated objective and the scale of investments. In each case they were originally designed to be larger operations but were scaled back to pilot operations but with scaling back their ambitious objectives. The design of both projects was complex and involved multiple implementation agencies but neither formalized institutional these partnerships with clearly defined common targets and timetables. Each faced difficulties in measuring the projects biophysical impacts.

*c. Land Administration Projects*

IEG conducted a series of project evaluations on land administration and titling projects. In **Ghana**, the Bank-supported **Land Administration Project** aimed to build on the government's National Land Policy, which aimed to "harmonize" statutory laws and customary interests bearing on land. The objective of the project was "to develop a sustainable and well-functioning land administration on system that is fair, efficient, cost effective, decentralized, and that enhances land tenure security." The project's biggest achievement was to open deeds offices in eight regions, thereby removing the need for people in these localities to travel great distances to register land. The IEG review found that land tenure reform requires a long-term commitment by the government and its development partners. The commitment may be facilitated by a programmatic lending instrument but the commitment must precede the choice of instrument – the instrument will not by itself create the necessary commitment. The Bank's good practice guidelines indicate that the efficiency of land administration services tends to be higher when they are handled by a single agency, but in practice, consolidating land agencies will not by itself ensure improved efficiency. This project also shows the risks with having multiple co-financiers: if each donor insists on imposing its own procurement and disbursement procedures, then implementation may be delayed. Divergence in the strategic priorities of the financiers may hinder the ability to achieve agreed-upon outcomes.

IEG prepared a PPAR for the **Lao PDR Second Land Titling Project**. In a country like Lao PDR, where there is little or no transparency in reviewing the status of land rights and limited enforcement of these rights, the security offered by land titles will always be qualified and the scope for expropriation is likely to be substantial. If the government is not willing to commit to a long-term program of land administration and to allocate the necessary budget, the benefits from land titling projects may not be achieved or sustained. Preparation of a long-term government program of land administration was an explicit aim of the first Bank-funded titling project implemented over 1996–2005, but when the second project was approved in 2003 the government had still not developed such a program. Meeting or exceeding titling targets does not necessarily mean that the process achieved full coverage of parcels eligible for systematic titling. Even though the government still says it will title all the estimated 1.6 million parcels by 2020, the promise of a land administration program remains unrealized, and about 1 million parcels remain without title. It may prove more effective for policy reforms and regulatory changes to be completed before a campaign of systematic land titling is launched. Systematic land titling does not necessarily ensure a significant and sustained increase in tenure security without impartial and efficient enforcement of the new land titles.

The original objective of the **Malawi Community-Based Rural Land Development Project** was to increase the incomes of 15,000 poor rural families through the implementation of a decentralized, voluntary, community-based land reform pilot program. IEG's PPAR found the project successfully settled 15,142 poor rural families and provided each with a two-hectare plot. Two separate impact evaluations found that the increase in incomes, farm output, and agricultural productivity of beneficiaries largely exceeded comparable results achieved by matched control groups. However, the boost to agricultural productivity was largest in the year after resettlement, tapering off after beneficiaries had used up their resettlement grant. A key lesson is that the willing buyer/willing seller approach to land redistribution can be made to work – but the institutional framework needed for success is demanding. The design details of this model of land reform are critical to its success, and giving the rural poor the option of homesteading remains a valid objective. Land redistribution is, however, but one part of a successful land reform project. Contract farming to help land reform beneficiaries shift from subsistence cultivation to cash cropping also merits closer investigation.

In **Indonesia**, the legal framework for land rights is more complex than in other countries in East Asia, and the formalization of land tenure has made less headway. IEG's PPAR for the **Land Management and Policy Development project** found that the project design largely neglected the geographic and thematic areas where tenure insecurity was most pronounced. Progress on increasing land tenure security was hindered by the absence of legal reforms and the patchiness of systematic titling.

Despite capacity-building activities, progress on increasing efficiency and transparency in local government land management functions was hampered by weak interagency coordination, both within provinces, and between the provinces and the central government. The evaluation noted three lessons. First, when the institutions bearing on land rights are poorly defined and not transparently administered, the priority needs to be championing legal and policy reform. Second, the gains from a program of systematic land titling may not be sustained if the cost of registering subsequent land transactions is high; and if the state often does not respect the private interest in land that has been formally registered. And third, the decentralization of land management may be compromised if transfers from central government are erratic and insufficient.

### *Social, Urban, Rural, and Resilience*

The Bank's **Indonesia Second Urban Poverty Project** (UPP2) expanded on the preceding UPP1, focused on alleviating urban poverty and fostering greater involvement of the urban poor in decision-making. IEG's PPAR found that participatory processes expanded the program's popularity, as shown by the peoples' willingness to (i) take part in the allocation of small grants for community development priorities, (ii) provide voluntary labor for the projects, and (iii) freely give up parcels of land for the communal good.

The Indonesia three-project Urban Poverty series was the primary vehicle to help mainstream the government urban poverty reduction program. Together, using combined IBRD and IDA financing of \$473 million and government financing of \$345 million, more than 5,000 kilometers of access roads were constructed, 1,700 kilometers of drainage systems and nearly 30,000 houses were rehabilitated, and a transparent management information system was established. IEG's PPAR, however, found some shortcomings, including insufficient evidence of project efficiency, inadequate maintenance arrangements, and revolving credit facilities that performed weaker than expected. The PPAR highlighted the need for greater attention to maintenance – by strengthening the technical capacity of communities to enable them to operate and maintain the facilities established, and to harmonize planned new investments with appropriate maintenance programs and budgets. The importance of maintenance needs to be stressed when Community Development Plans are drawn up.

In **China**, both the **Second Tianjin Urban Development and Environment Project** (\$150 million) and the **Chongqing Small Cities Infrastructure Improvement Project** (\$180 million) addressed how to improve urban services for a rapidly growing population. Both projects provided the needed infrastructure services, increased area coverage, and in some cases promoted local economic development. IEG's PPAR found, however, that the infrastructure under the Chongqing project was not as high standard,

and was less well maintained than in Tianjin, thus posing risks to the sustainability of outcomes. Key lessons from the IEG PPAR are: (i) the achievement of a results-focused Bank operation requires a well-defined and clearly stated project development objective, and a comprehensive M&E framework; and (ii) the Bank can increase the effectiveness of its support by tailoring the Bank's services and instruments to the more localized needs and capacity of the borrower.

In **West Bank and Gaza**, IEG conducted a cluster PPAR on municipal development projects. The two projects Second Emergency Municipal Services Rehabilitation Project, and the Municipal Development Program—Phase I are part of a series of projects funded by the World Bank and development partners that aims to improve municipal management in provision of municipal services. The **Second Emergency Municipal Services Rehabilitation Project**, undertook rehabilitation activities to avoid deterioration of infrastructure such as roads and water supply. According to the beneficiary satisfaction survey, citizens were fairly satisfied with the services provided by municipalities. Had these sub-project investments not been undertaken to improve solid waste services and rehabilitate buildings, roads, water, and sanitation lines, this infrastructure would have further deteriorated and services to communities would have been downgraded. The project assisted in the creation of job opportunities at the local level. Labor intensive activities were used in several municipal small projects, including digging culverts, construction of retaining walls, roads and drainage.

The **Municipal Development Program—Phase I** financed municipal infrastructure investments such as roads, water, wastewater, solid waste, and public buildings in order to improve services. Capacity building supported municipalities in their reform efforts and strengthened national institutions (Ministry of Local Government and the Municipal Development and Lending Fund) as well as local institutions (municipalities and local communities) in the conduct of their operations and development of projects and policies. About 96 percent of the municipalities have graduated to a higher performance level based on the performance criteria developed under the project. About 70 percent of the municipalities are applying at least two public disclosure methods such as municipal budgets, strategic development plans, or external audits.

### *Water*

In **Senegal**, IEG conducted a cluster PPAR for the **Long-Term Water Sector Project** and the Access to Onsite Sanitation Services Output-based Aid Scheme that yielded useful lessons on inclusive growth and risks to development outcomes. Targets were well exceeded. New water connections had reached 690,000 people in the secondary cities in addition to 725,000 people in Dakar. Investments in social connections increased access to water supply for low-income households from 50,000 in 2001 to 150,000 in 2009, and

further to 250,000 by the end of 2012. The project has contributed to increasing the water supply coverage from 91 percent in 2004 to 97 percent of urban population at project closure in 2009, and to 99 percent at end-2013. Most of the targets set at appraisal were met also for sanitation. With the extension of the sewerage networks, sewerage connections reached about 144,000 more people, 92,000 of whom were in Dakar and 52,000 were in secondary urban areas. However, the long-term sustainability of outcomes is questionable. The public utilities have weak financial viability due primarily to the low water tariff for private connections, and lack of proper mechanisms to ensure maintenance of the sanitation system. IEG's PPAR yielded the following important lessons:

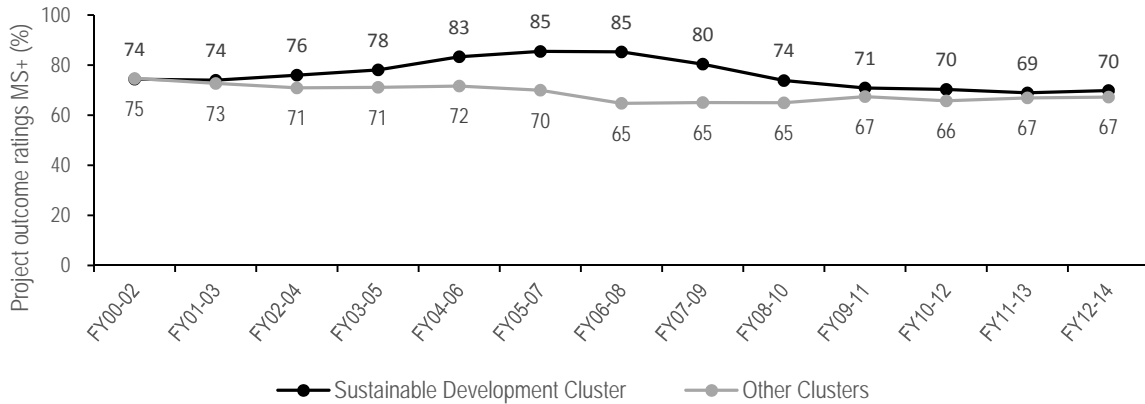

- Premature cessation of donor engagement could lead to a loss of momentum for major sector reform.
- Benefits of water investments may not be realized without adequate attention to sanitation.
- Raising tariffs only for one customer group is not effective for ensuring long-term sustainability.
- Determining the right threshold of the beneficiary contribution is vital for the successful delivery of peri-urban sanitation services.
- Complex management and institutional arrangements lead to implementation delays.

---

<sup>1</sup> The Sustainable Development Cluster had 18 development policy loans in FY12–14 compared with 87 in the Human Development and Equitable Growth, Finance, and Institutions Clusters.
